#### § 878.4430

- (ii) A statement that the safety and effectiveness of the device's use for uses other than the indicated aesthetic use are not known.
- (iii) A summary of the clinical information used to establish effectiveness for each indicated aesthetic usage and observed adverse events.

[81 FR 42244, June 29, 2016]

## §878.4430 Microneedling device for aesthetic use.

- (a) Identification. A microneedling device for aesthetic use is a device using one or more needles to mechanically puncture and injure skin tissue for aesthetic use. This classification does not include devices intended for transdermal delivery of topical products such as cosmetics, drugs, or biologics.
- (b) Classification. Class II (special controls). The special controls for this device are:
- (1) The technical specifications and needle characteristics must be identified, including needle length, geometry, maximum penetration depth, and puncture rate.
- (2) Non-clinical performance data must demonstrate that the device performs as intended under anticipated conditions of use. The following performance characteristics must be tested:
- (i) Accuracy of needle penetration depth and puncture rate;
- (ii) Safety features built into the device to protect against cross-contamination, including fluid ingress protection; and
- (iii) Identification of the maximum safe needle penetration depth for the device for the labeled indications for use
- (3) Performance data must demonstrate the sterility of the patient-contacting components of the device.
- (4) Performance data must support the shelf life of the device by demonstrating continued sterility, package integrity, and device functionality over the intended shelf life.
- (5) Performance data must demonstrate the electrical safety and electromagnetic compatibility (EMC) of all electrical components of the device.
- (6) Software verification, validation, and hazard analysis must be performed

for all software components of the device.

- (7) The patient-contacting components of the device must be demonstrated to be biocompatible.
- (8) Performance data must validate the cleaning and disinfection instructions for reusable components of the device.
- (9) Labeling must include the following:
- (i) Information on how to operate the device and its components and the typical course of treatment;
- (ii) A summary of the device technical parameters, including needle length, needle geometry, maximum penetration depth, and puncture rate;
- (iii) Validated methods and instructions for reprocessing of any reusable components;
  - (iv) Disposal instructions; and
  - (v) A shelf life.
- (10) Patient labeling must be provided and must include:
- (i) Information on how the device operates and the typical course of treatment:
- (ii) The probable risks and benefits associated with use of the device; and
- (iii) Postoperative care instructions.

[83 FR 26577, June 8, 2018]

### § 878.4440 Eye pad.

- (a) *Identification*. An eye pad is a device that consists of a pad made of various materials, such as gauze and cotton, intended for use as a bandage over the eye for protection or absorption of secretions.
- (b) Classification. Class I (general controls). The device is exempt from the premarket notification procedures in subpart E of part 807 of this chapter, subject to the limitations in §878.9.

[53 FR 23872, June 24, 1988, as amended at 59 FR 63010, Dec. 7, 1994; 66 FR 38803, July 25, 20011

### § 878.4450 Nonabsorbable gauze for internal use.

(a) Identification. Nonabsorbable gauze for internal use is a device made of an open mesh fabric intended to be used inside the body or a surgical incision or applied to internal organs or structures, to control bleeding, absorb fluid, or protect organs or structures

### Food and Drug Administration, HHS

from abrasion, drying, or contamination. The device is woven from material made of not less than 50 percent by mass cotton, cellulose, or a simple chemical derivative of cellulose, and contains x-ray detectable elements.

(b) Classification. Class I (general controls). The device is exempt from the premarket notification procedures in subpart E of part 807 of this chapter, subject to the limitations in §878.9.

# § 878.4452 Nonabsorbable expandable hemostatic sponge for temporary internal use.

(a) Identification. A nonabsorbable expandable hemostatic sponge for temporary internal use is a prescription device intended to be placed temporarily into junctional, non-compressible wounds, which are not amenable to tourniquet use, to control bleeding until surgical care is acquired. The sponges expand upon contact with blood to fill the wound cavity and provide a physical barrier and pressure that facilitates formation of a clot. The device consists of sterile, nonabsorbable radiopaque compressed sponges and may include an applicator to facilitate delivery into a wound.

- (b) Classification. Class II (special controls). The special controls for this device are:
- (1) Performance data must demonstrate the biocompatibility of patient-contacting components.
- (2) Performance data must demonstrate the sterility of patient-contacting components including endotoxin and pyrogenicity assessments.
- (3) Performance data must support device stability by demonstrating continued sterility of the patient-contacting components of the device, package integrity, and device functionality over the requested shelf life.
- (4) Assessment of material characteristics must be sufficient to support safety under anticipated conditions of use. Assessments must include the following:
  - (i) Material specifications.
  - (ii) Immunogenicity.

- (iii) Viral inactivation for animal-derived materials
- (5) Non-clinical performance data must demonstrate that the device performs as intended under anticipated conditions of use. The following performance characteristics must be tested:
  - (i) Absorption capacity.
  - (ii) Extent of swelling.
  - (iii) Mechanical properties.
  - (iv) Expansion force/pressure.
  - (v) Radiopacity.
- (6) In vivo performance data must demonstrate safe and effective use by verifying that the device performs as intended under anticipated conditions of use. Appropriate analysis/testing must demonstrate that the product: Controls bleeding, does not promote adverse local or systemic effects, and can be completely removed from the wound. The following performance characteristics must be tested:
  - (i) Deployment.
  - (ii) Control of bleeding.
  - (iii) Radiopacity.
  - (iv) Retrieval.
- (v) Assessment of local and systemic effects.
- (7) Human factors testing and analysis must validate that the device design and labeling are sufficient for appropriate use by emergency responders deploying the device as well as surgeons retrieving the device from wounds.
  - (8) Labeling must include:
- (i) Specific instructions for deployment by emergency responders and retrieval by surgeons.
- (ii) Warnings, cautions, and limitations needed for safe use of the device.
- (iii) Information on how the device operates and the typical course of treatment.
- (iv) A detailed summary of the in vivo and human factors testing pertinent to use of the device.
- (v) Appropriate imaging information to ensure complete retrieval of device.
  - (vi) An expiration date/shelf life.
