**PAY TO DELAY: ARE PATENT SETTLEMENTS
THAT DELAY GENERIC DRUG MARKET
ENTRY ANTICOMPETITIVE?**

WEDNESDAY, JUNE 3, 2009

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COURTS AND
COMPETITION POLICY
COMMITTEE ON THE JUDICIARY,
Washington, DC.

The Subcommittee met, pursuant to notice, at 10:04 a.m., in room 2237, Rayburn House Office Building, the Honorable Henry C. “Hank” Johnson, Jr. (Chairman of the Subcommittee) presiding.

Present: Representatives Johnson, Conyers, Gonzalez, Jackson Lee, Watt, Sherman, Coble, Sensenbrenner, and Goodlatte.

Staff present: (Majority) Christal Sheppard, Subcommittee Chief Counsel; Elizabeth Stein, Counsel; Rosalind Jackson, Professional Staff Member; (Minority) Stewart Jeffries, Counsel; Johnny Mautz, Staff Member.

Mr. JOHNSON. The hearing of the Subcommittee on Courts and Competition Policy will now come to order.

Without objection, the Chair will be authorized to declare a recess for the hearing.

Pay-to-delay settlements have been the subject of legislation introduced in both the House and the Senate. The House Energy and Commerce Committee has held numerous hearings on that issue in the 110th and the 111th Congresses. So this is clearly an issue of concern to the Judiciary Committee and, in particular, this Subcommittee.

Pay-to-delay or reverse payment settlements only arise in the context of litigation over patents, and patent law is an important part of the full Committee’s jurisdiction. The settlements also fundamentally affect competition in the pharmaceutical industry. This is a matter of deep concern to the Subcommittee—it is important to give our Members the opportunity to hear from the experts, both positive and negative, who are here today.

And this issue is really about balancing two necessary but opposing interests: one, the need to promote the advancement of medicine and health care; and the need to make health care available to as many people—to everyone for as little money as possible. It is about balancing the artificial monopoly of a patent into the competitive pricing of generic drugs.

On the other hand, we need to ensure that pioneer drug companies have the resources and incentives to continue developing—drugs—in order to continue developing new therapies for the benefit of mankind. But when entry of a generic drug into the market is unnecessarily or artificially delayed, consumers, patients and taxpayers are all harmed because they continue to pay premium prices for drugs. We need to be sure that we are doing everything we can to ensure that unnecessary delays do not happen.

Today, ladies and gentlemen, we will look at the nature of these settlements. Usually settling a lawsuit is considered to be a good thing, an efficient and cost-saving way to resolve issues. The pioneer and generic drug companies, and to a large degree, the courts, tend to regard reverse payment settlements in that way.

The Federal Trade Commission, on the other hand, sees them as per se anti-competitive and a violation of long-established antitrust laws.

Our distinguished panel of witnesses will present both views today, and I am confident we will come away with a sound basis to make our further decisions on this topic fruitful, and to come up with a consensus about how we should move forward.

There are a number of avenues to explore in looking for the best way to handle brand generic patent settlements. We can try to develop criteria that would signal whether a settlement is beneficial to consumers in keeping with the intent of the Hatch-Waxman act. We can provide a framework for reviewing settlements to ensure that the criteria for a competitive settlement are met.

And another approach is that we may consider ensuring that the 180-day exclusivity period is awarded appropriately to a generic company that actually opens a market to generic versions of the challenged drug that would otherwise remain closed.

In conjunction with that approach, we can take steps to ensure that the 180-day exclusivity period is of sufficient value to a generic drug company to provide a meaningful incentive to challenge the pioneer drug. One such step may be to prevent the pioneer company from marketing or authorizing the marketing of a generic version of its own drug.

These are just some of the ways we might promote competition in the pharmaceutical market while maintaining the incentives to discover and develop new drugs. I am sure that others will come to light during the course of this hearing.

And I will now recognize my colleague, Congressman Coble, the Ranking Member of this Committee, Subcommittee.

Mr. COBLE. Thank you, Mr. Chairman.

I am sorry for my belated arrival. It started out as a hectic day. I am sure the panelists have never had hectic days plaguing them, I say with tongue in cheek. I have two other hearings, Mr. Chairman, that I will have to attend ultimately.

But today's hearing, Mr. Chairman, is a homecoming of sorts for this Subcommittee. Prior to this Congress, you will recall the Subcommittee—Courts, Internet, and Intellectual Property Subcommittee, and it has jurisdiction over all things patent-related. And I am glad we are seeing the return of some of these important issues to this Subcommittee.

That said, the subject matter—you touched on some of it, Mr. Chairman. But the subject matter for today's hearing is complex. It touches on antitrust, patent, and health care—feel that Hatch-Waxman, which was created in 1984, was and still is good policy. Without Hatch-Waxman, there would be no generic pharmaceutical industry, it seems to me.

This delicate balance between permitting generics to challenge patents and providing them with exclusivity and permitting patent holders from molecular entities, usually one of the brand companies, to extend their patent terms to compensate for delays during FDA review has been very effective and is still widely supported.

That said, there are some practices that have been called into question. And while I have not embraced or rejected any of the arguments that are being made, it goes without saying that efficiencies in our health care system are a top priority for everyone.

The Federal Trade Commission feels very strongly that some settlements between brand and generic pharmaceutical companies which have survived the rule of reason test in our Federal courts should be prohibited because they inhibit innovation and are alleged to increase the cost of pharmaceuticals.

On the other hand, proponents of the current system, most of the pharmaceutical industry, contend that these claims are patently false and that the settlements actually foster innovation and growth and ensure the future of many disease-curing drugs that are still being researched today.

The pharmaceutical industry argues that, without settlements, there would be an incentive to litigate against each other, thereby increasing costs, delaying new products for the market, and creating enormous amounts of uncertainty that their investments, oftentimes in the billions, can be wiped out by a lawsuit. Furthermore, they argue that the notion of a settlement scheme of pay-to-delay is already prohibited by section five of the FTC Act.

Our pharmaceutical industry leads the world. The Hatch-Waxman act has been successful. And before we move to tip this balance, one simple question we should address is how any change will affect the industry as a whole.

I concur, Mr. Chairman, wholeheartedly with the effort to cut wasteful expenses from our health care system. And while I am very interested to know how intellectual property rights are being served and whether the market is operating freely, many of my constituents who rely upon medicines want to know how these settlements are either enhancing or impeding their daily lives.

Finally, I am aware that this issue has generated some legislation which is being considered at the House Energy and Commerce Committee. And I feel very strongly, Mr. Chairman, that it is incumbent on the Judiciary Committee to also have a say in this matter. I look forward to hearing from our witnesses on this important topic, and I yield back the balance of my time.

Mr. JOHNSON. I thank the gentleman for his statement.

And without objection, other Members' opening statements will be included in the record.

I am now pleased to introduce the witnesses for today's hearing. First is Mr. Richard Feinstejn, who is the director of the Bureau of Competition at the Federal Trade Commission. He has pre-

viously been assistant director in the bureau's health care services and products division and worked as a trial attorney and supervisor in the DOJ's antitrust division. Mr. Feinstein has also been in private practice, primarily focusing upon antitrust litigation and counseling.

Welcome, sir.

Second is Ms. Heather Bresch, who is executive vice president and chief operating officer for Mylan, a supplier of generic and specialty pharmaceuticals. During the past 17 years, she has worked in a kind of a graduated from entry-level to a top-level position for which she is to be congratulated, of course, as is Mr. Feinstein.

And she is currently responsible for Mylan's global and technical operations. Ms. Bresch worked hard to pass the 2003 Medicare Modernization Act and has served consecutive terms as chair of the Generic Pharmaceutical Association.

Next, we will hear from Mr. William Kennedy, who is owner and CEO of Nephron Pharmaceuticals, a small generic manufacturer specializing in respiratory medication. He is a pharmacist who has previously owned a retail pharmacy and founded a home-care company specializing in respiratory medical equipment and care.

Welcome, sir.

Fourth is Mr. Guy Donatiello, who is the vice president for intellectual property for Endo Pharmaceuticals. At Endo, Mr. Donatiello is responsible for all aspects of intellectual property. Prior to joining Endo, he specialized in intellectual property issues for pharmaceutical and biotechnology companies as an in-house attorney and as external counsel. He has 20 years of intellectual property experience and has been an adjunct professor at Villanova School of Law.

Welcome, sir.

And next will be Mr. William Vaughan, who, from 1965 to 2001, worked for various Members of the House Ways and Means Committee and as staff director for the minority on the Subcommittee on Health. Since 2001, he has worked as a lobbyist for Families USA and in his current position as senior health policy analyst for Consumers Union.

Welcome, sir.

And, finally, we will hear from Mr. Bret Dickey, the senior vice president of Compass Lexecon, a consulting firm specializing in competition policy. Mr. Dickey earned a Ph.D. in economics from Stanford University and, prior to joining Compass Lexecon, was an economist—with LEGC, a company that conducts studies and provides expert testimony and strategic and financial advice services. He has written two academic papers on the topic of patent settlements.

And we want to welcome you here, too, today, sir.

I appreciate everyone's willingness to participate in today's hearing. Without objection, your written statement will be placed into the record, and we would ask that you limit your oral remarks to 5 minutes.

You will note that we have a lighting system. It starts with the green light. At 4 minutes, it turns yellow, then red at 5 minutes. As each witness has presented his or her testimony, Subcommittee Members will be permitted to ask questions, subject to the 5-minute rule.

Mr. Feinstein, are you ready to proceed with your testimony, sir?

Mr. FEINSTEIN. I am.

Mr. JOHNSON. Alright.

Ms. Bresch, will you begin your testimony, please?

I am sorry. Mr. Feinstein, go ahead.

**TESTIMONY OF RICHARD FEINSTEIN, DIRECTOR, BUREAU OF
COMPETITION, FEDERAL TRADE COMMISSION, WASH-
INGTON, DC**

Mr. FEINSTEIN. Thank you, Mr. Chairman and Ranking Member Coble and Members of the Committee. I appreciate the opportunity to testify at this hearing.

The issue of pay-for-delay settlements in the pharmaceutical industry is a worthy and very timely subject for this Subcommittee's attention. These anticompetitive agreements impose enormous costs on the U.S. health care system. For just a single drug, those costs can amount to billions of dollars. Consumers, businesses, and governments are footing the bill, and that bill will only get larger if pay-for-delay settlements are not eliminated.

I should note for the record that the written statement that has been acknowledged represents the views of the agency. My oral testimony today represents my own views and not necessarily the views of the commission.

I would like to begin by briefly describing the problem that we are here to discuss. Pay-for-delay settlements of patent litigation—are settlements of patent litigation in which the brand-name drug firm pays its potential generic competitor to abandon a patent challenge and to delay entering the market with a lower-cost generic product. These arrangements are also known as exclusion payment or reverse payment settlements.

These settlements arise in the context of the special patent challenge system devised by Congress for the pharmaceutical industry, which is, of course, the Hatch-Waxman regime. When Congress enacted the 1984 Hatch-Waxman act, one of the key steps it took to encourage speedy introduction of generics was to establish mechanisms for firms seeking approval of generic drugs to challenge invalid or narrow patents on brand of drugs.

Experience has shown the wisdom of that congressional action. When tested in the courts, the branded drug patents often did not withstand judicial scrutiny, and the savings have been enormous. Generic entry resulting from these successful patent challenges has played a key role in helping Americans afford the medicines they need.

But while patent challenges can deliver big savings for consumers, the economics of brand-generic competition create a powerful incentive for brand and generic manufacturers to agree to terminate the patent case and instead avoid competition and share the resulting profits.

The reason is simple: Because generic drugs are so much cheaper than the branded form, the profits that the generic expects to make will be much less than the profits that the brand stands to lose. The result is typically more profitable for both sides if the brand-new company pays a generic company to settle the patent dispute and agree to defer its entry. This is a win-win for the drug compa-

nies, but consumers and the Federal Government, who were, of course, not at the table when this deal was struck, are the losers.

Agreements to eliminate potential competition and share the resulting profits are at the core of what the antitrust laws proscribe. Notably, since this issue first arose in 1998, every single member of the Federal Trade Commission, whether Democrat, Republican or independent, has supported the commission's challenges to anti-competitive pay-for-delay deals.

But since 2005, the court decisions have taken a lenient approach to such agreements. As a result, it has become increasingly difficult to use antitrust law to stop pay-for-delay settlements. Some settlements have become a common industry strategy, and we observed a dramatic increase in the number of settlements that include compensation to the generic coupled with a restriction on generic entry.

In other words, the pay-for-delay settlement problem is extremely costly and increasingly prevalent. As Congressman Waxman has observed, pay-for-delay settlements have turned the Hatch-Waxman act on its head. The law was designed to save consumers money by giving generic companies an incentive to challenge weak patents and to compete. Instead, generic companies are getting paid handsomely to sit on the sidelines.

The FTC is not alone in its concerns. Consumer groups, the AMA, state attorneys general, and legal and economic scholars have all spoken out about this problem.

The pharmaceutical industry has largely, though not entirely, defended pay-for-delay deals and asserted that they benefit, rather than harm consumers. Let me comment briefly on arguments often made.

First, the suggestion that Hatch-Waxman patent cases cannot be settled without deals to pay a generic to delay entry was contradicted by actual market experience from 2000 to 2004, when the prospect of antitrust enforcement was deterring such settlements. Companies continued to settle, but they did so without exclusion payments.

Second, just because a settlement permits a generic to enter before the patent expires does not necessarily mean the consumers benefit. Granted, firms do not pay generics to accelerate entry; they do so when it is the only—when it is the only way to get the generic to accept the brand's preferred entry date.

The claim made by some that barring pay-for-delay settlements would reduce innovation and result in fewer life-saving drugs is a serious charge, but it glosses over what even defenders of these settlements have conceded: that the incentive to pay a generic to abandon its patent challenge is greatest for the weakest patents.

Allowing pay-for-delay settlements gives holders of drug patents the ability to buy more protection from competition than congressionally granted patent rights afford. These deals disrupt the careful balance between patent protections and encouraging generic drug entry that Congress sought to achieve in the Hatch-Waxman act.

Finally, some assert that barring pay-for-delay settlements will lead to fewer patent challenges by generic firms, but it is important to recognize that the measure of success of the patent challenge

process is not the number of patent challenges filed, but the extent to which such challenges actually deliver savings to consumers.

If generic firms file patent challenges that simply result in payments to drop the challenge, then the purpose of encouraging such challenges is defeated.

As our written statement reflects, the agency supports a legislative solution that would eliminate pay-for-delay settlements. The FTC is continuing to investigate and bring cases to try to protect consumers from these anticompetitive settlements, but the enormous costs of these deals make waiting for a solution in the courts an expensive proposition, particularly at a time when the Nation is searching for ways to reform health care.

H.R. 1706 offers a straightforward means to quickly combat anti-competitive conduct that is pervasive and costly to consumers, while also providing flexibility to protect procompetitive arrangements.

Thank you very much. I would be happy to answer any questions the Subcommittee may have.

[The prepared statement of Mr. Feinstein follows:]

PREPARED STATEMENT OF RICHARD FEINSTEIN

**PREPARED STATEMENT OF THE
FEDERAL TRADE COMMISSION**

Before the

**SUBCOMMITTEE ON COURTS AND COMPETITION POLICY
COMMITTEE ON THE JUDICIARY
UNITED STATES HOUSE OF REPRESENTATIVES**

on

**“Anticompetitive Pay-for-Delay Settlements in the Pharmaceutical Industry:
Why Consumers and the Federal Government Are Paying
Too Much for Prescription Drugs”**

June 3, 2009

Chairman Johnson, Ranking Member Coble, and members of the Subcommittee, I am Richard A. Feinstein, Director of the Federal Trade Commission's Bureau of Competition. I appreciate the opportunity to appear before you today to testify on behalf of the Commission about the need for legislation to prevent anticompetitive agreements between branded and generic drug firms that delay consumer access to generic drugs.¹ And the Commission appreciates the Subcommittee's attention to this issue of great importance not only to consumers but also to the federal and state governments, which spend substantial sums on prescription drugs. Since this issue first arose in 1998, every single member of the Commission, past and present, – whether Democrat, Republican, or Independent – has supported the Commission's challenges to anticompetitive "pay-for-delay" deals.

The threat that these agreements pose to our nation's health care system is a matter of pressing national concern. The enormous costs that result from unwarranted delays in generic entry burden consumers, employers, state and local governments, and federal programs already struggling to contain spiraling costs. Furthermore, these deals to delay generic entry will increase the cost of health care reform proposals that seek to extend coverage to the uninsured. Over twenty years ago, Congress passed the Hatch-Waxman Act,² which was designed to prevent weak patents from obstructing lower-cost, generic competition and has helped control the costs of prescription drugs. But pay-for-delay settlements of patent cases, which are unique

¹ This written statement represents the views of the Federal Trade Commission. My oral presentation and responses to questions are my own and do not necessarily reflect the views of the Commission or of any Commissioner.

² Drug Price Competition and Patent Term Restoration Act of 1984, Pub. L. No. 98-417, 98 Stat. 1585 (1984) (codified as amended 21 U.S.C. § 355 (1994)). For a discussion of the Act's statutory background, see "Protecting Consumer Access to Generic Drugs: The Benefits of a Legislative Solution to Anticompetitive Settlements in the Pharmaceutical Industry," FTC Testimony before the Subcommittee on Trade, Commerce, and Consumer Protection, Committee on Energy and Commerce (May 2, 2007) at 8-9, available at http://ftc.gov/os/testimony/P859910%20Protecting_Consumers%20Access_testimony.pdf.

to the Hatch-Waxman setting, threaten to extinguish that benefit. Therefore, congressional action to prohibit these costly and anticompetitive settlements is both appropriate and timely.

The FTC has sought to use antitrust enforcement to stop “pay-for-delay settlements” (also known as “exclusion payment” or “reverse payment” settlements). These are settlements of patent litigation in which the brand-name drug firm pays its potential generic competitor to abandon a patent challenge and delay entering the market with a lower cost, generic product. Such settlements effectively buy more protection from competition than the assertion of the patent alone provides. And they do so at the expense of consumers, whose access to lower-priced, generic drugs is delayed, sometimes for many years.

Agreements to eliminate potential competition and share the resulting profits are at the core of what the antitrust laws proscribe, and for that reason these pay-for-delay settlements should be prohibited under the antitrust laws. But since 2005, court decisions have taken a lenient approach to such agreements in drug patent settlements. As a result, it has become increasingly difficult to bring antitrust cases to stop pay-for-delay settlements, and such settlements have become a common industry strategy. As one investment analyst report put it, the courts’ permissive approach to exclusion payments has “opened a Pandora’s box of settlements.”³

The implications of these developments are extremely troubling. The increased costs resulting from anticompetitive agreements that delay generic competition harm all those who pay for prescription drugs: individual consumers, the federal government, state governments

³ Stephanie Kirchaessner & Patti Waldmeir, *Drug Patent Payoffs Bring a Scrutiny of Side-Effects*, FINANCIAL TIMES UK, Apr. 25, 2006, 2006 WLNR 6910048 (quoting S.G. Cowen & Co. analyst’s report describing the Eleventh Circuit’s opinion in *Schering-Plough Corp. v. FTC*, 402 F.3d 1056 (11th Cir. 2005), *cert. denied*, 548 U.S. 919 (2006)).

trying to provide access to health care with limited public funds, and American businesses striving to compete in a global economy. The federal government is particularly affected: Federal dollars accounted for an estimated 31 percent of the \$235 billion spent on prescription drugs in 2008, and that share is expected to rise to 40 percent by 2018.⁴

To be sure, the development of new drugs is risky and costly, and preserving incentives to undertake this task is critically important. Due regard for patent rights is thus a fundamental premise of the Hatch-Waxman Act's framework. But the court decisions allowing pay-for-delay settlements grant holders of drug patents the ability to buy protection from competition based only on an allegation of infringement – more protection than congressionally-granted patent rights afford. These rulings disrupt the careful balance between patent protections and encouraging generic drug entry that Congress sought to achieve in the Hatch-Waxman Act.

For these reasons, the Commission strongly supports H.R. 1706, which would prohibit these anticompetitive settlements.⁵ And we are encouraged that the list of those speaking out against pay-for-delay settlements is growing. President Obama's budget proposal expresses the Administration's opposition to these anticompetitive deals,⁶ and Assistant Attorney General

⁴ Centers for Medicare and Medicaid Services, Office of the Actuary, Table 11, *Prescription Drug Expenditures; Aggregate and per Capita Amounts, Percent Distribution and Annual Percent Change by Source of Funds: Calendar Years 2003–2018* (2009), available at <http://www.cms.hhs.gov/NationalHealthExpendData/downloads/proj2008.pdf>

⁵ Similar legislation has been introduced in the Senate. See *Preserve Access to Affordable Generics Act*, S. 369, 111th Cong. (2009).

⁶ President Obama explained in his recent budget that “The Administration will prevent drug companies from blocking generic drugs from consumers by prohibiting anticompetitive agreements and collusion between brand name and generic drug manufacturers intended to keep generic drugs off the market.” OFFICE OF MGMT. & BUDGET, EXEC. OFFICE OF THE PRESIDENT, BUDGET OF THE UNITED STATES GOVERNMENT, FISCAL YEAR 2010 (2009) (proposed), at 28, available at http://www.whitehouse.gov/omb/asscts/fy2010_ncw_cra/A_New_Era_of_Responsibility2.pdf.

Christine Varney has testified that she supports stopping them.⁷ In addition, this past summer the American Medical Association House of Delegates adopted a resolution announcing its opposition to pay-for-delay settlements.⁸

As is discussed below, the Commission is continuing to bring cases challenging pay-for-delay settlements despite the difficulties created by several recent court decisions. But we believe there are compelling reasons for Congress to act to stop such anticompetitive agreements and that the approach taken in H.R. 1706 is sound.

I. The Need for a Legislative Solution

Legislation can provide a comprehensive solution to a problem that is prevalent, extremely costly, and subverts the goals of the Hatch-Waxman Act.

A. Permissive court decisions have made pay-for-delay settlements commonplace in Hatch-Waxman patent cases

The Sixth Circuit Court of Appeals held in 2003 that a branded drug firm's exclusion payments to a generic firm that had filed a patent challenge were per se unlawful, noting:

it is one thing to take advantage of a monopoly that naturally arises from a patent, but another thing altogether to bolster the patent's effectiveness in inhibiting competitors by paying the only potential competitor \$40 million per year to stay out of the market.⁹

⁷ In response to a question in her recent confirmation hearing before the Senate Judiciary Committee, Ms. Varney testified that she supported opposition to "reverse payments" and would work to "align" the positions of the Department of Justice and the FTC. *Executive Nominations: Hearing Before the S. Judiciary Comm.*, 111th Cong. 38-39 (2009) (exchange between Sen. Herb Kohl, Member, S. Judiciary Comm., and Christine Anne Varney, Nominee, Assistant Att'y Gen., Antitrust Division, Department of Justice).

⁸ At its 2008 annual meeting, the House of Delegates of the American Medical Association adopted Resolution 520 concerning "Pay for Delay Arrangements by Pharmaceutical Companies" and resolved "that our American Medical Association support the Federal Trade Commission in its efforts to stop 'pay for delay' arrangements by pharmaceutical companies," available at <http://www.ama-assn.org/ama/pub/upload/mm/38/a08resolutions.pdf>.

⁹ *In re Cardizem CD Antitrust Litig.*, 332 F.3d 896, 908 (6th Cir. 2003).

But in 2005, two appellate courts adopted a more permissive – and, respectfully, in our view, incorrect – position on pay-for-delay settlements.¹⁰ The Eleventh Circuit reversed the Commission’s decision in the *Schering* case that a substantial exclusion payment, made to induce the generic to abandon its efforts to enter the market before expiration of the branded drug’s patent, was illegal.¹¹ In doing so, the Eleventh Circuit not only rejected the Sixth Circuit’s approach to pay-for-delay settlements, it refused to apply any antitrust analysis, either the per se rule or the rule of reason.¹² The Second Circuit in the *Tamoxifen* case likewise upheld the legality of a pay-for-delay settlement.¹³ In 2008, a third appellate court adopted a similarly lenient view of pay-for-delay settlements.¹⁴ In that case, *Cipro*, the Federal Circuit Court of Appeals held that “absent fraud before the [Patent and Trademark Office] or sham litigation,” the mere presence of a patent entitles the patent holder to purchase protection from competition

¹⁰ *Schering-Plough Corp. v. FTC*, 402 F.3d 1056 (11th Cir. 2005), cert. denied, 548 U.S. 919 (2006); *In re Tamoxifen Citrate Antitrust Litig.*, 429 F.3d 370 (2d Cir. 2005) (Pooler, J., dissenting), amended, 466 F.3d 187 (2d Cir. 2006), cert. denied, 127 S.Ct. 3001 (2007). For further discussion of the *Schering* and *Tamoxifen* cases, see the FTC’s May 2, 2007 testimony, “Protecting Consumer Access to Generic Drugs,” *supra* note 2, at 14-19, available at http://www.ftc.gov/os/testimony/P859910%20Protecting_Consumers%20Access_testimony.pdf.

¹¹ *In the Matter of Schering-Plough Corp.*, Docket No. 9297, Federal Trade Commission, 2003 FTC LEXIS 187, Dec. 8, 2003; vacated, *Schering-Plough Corp. v. FTC*, 402 F.3d 1056, 1065 (11th Cir. 2005).

¹² 402 F.3d at 1065.

¹³ *In re Tamoxifen Citrate Antitrust Litig.*, 429 F.3d 370 (2d Cir. 2005) (Pooler, J., dissenting), amended, 466 F.3d 187 (2d Cir. 2006).

¹⁴ *In re Ciprofloxacin Hydrochloride Antitrust Litig.*, 544 F.3d 1323 (Fed. Cir. 2008), petition for cert. filed, ___ U.S.L.W. ___ (U.S. Mar. 23, 2009) (No. 08-1194).

until patent expiration.¹⁵ Plaintiffs have asked the Supreme Court to review the *Cipro* decision, and we believe the Court should do so.¹⁶

The Commission believes that the courts' permissive approaches in *Cipro*, *Tamoxifen*, and *Schering* are misguided and not supported by the law. These holdings disrupt the carefully balanced patent system by overprotecting weak and narrow patents, allowing patent holders to buy protection that their patents cannot provide; and ignoring consumers' interests in competition safeguarded by the antitrust laws. The Commission is not the only advocate to voice concern about the harmful effects of these decisions. Former Solicitor General Paul Clement criticized the standard set forth in *Tamoxifen* as "erroneous" and "insufficiently stringent . . . for scrutinizing patent settlements."¹⁷ The Solicitor General observed that "[t]he interests in consumer welfare protected by the antitrust laws militate against adoption of a legal standard that would facilitate a patent holder's efforts to preserve a weak patent by dividing its monopoly profits with an alleged infringer."¹⁸ Forty-one legal scholars, economics professors, and other academics likewise deemed the *Tamoxifen* standard to be "far outside the mainstream

¹⁵ *Id.* at 1336. Bayer had settled patent litigation with the manufacturer of a generic counterpart, Barr, by making periodic payments to Barr ultimately totaling almost \$400 million in exchange for Barr's agreement to delay marketing its generic version of Cipro for almost seven years. The Commission filed an amicus brief in *Cipro* that urged the Federal Circuit to allow an antitrust challenge to the patent settlement to proceed to trial, available at <http://www.ftc.gov/os/2008/01/ciprobrief.pdf>.

of judicial and academic analysis.”¹⁹ Indeed, the Second Circuit, which decided *Tamoxifen* and now has another exclusion payment case before it, has asked the Department of Justice to submit a brief addressing the legality of a branded drug manufacturer’s paying its potential generic rival to abandon its patent challenge and refrain from competing.

Because this is such an important issue for consumers, the Commission continues to bring antitrust challenges to pay-for-delay settlements in other circuits despite the permissive legal treatment afforded these settlements by three of the four circuits that have considered the issue. The Commission currently has two pending cases challenging pay-for-delay settlements.²⁰ We also have a number of ongoing non-public investigations of such settlements.

The first case, filed in February 2008, challenges a course of anticompetitive conduct by Cephalon, Inc. to prevent generic competition to its leading product, Provigil, a drug used to treat excessive sleepiness caused by narcolepsy and sleep apnea, with annual sales of more than \$800 million.²¹ The complaint charges that Cephalon agreed to pay in excess of \$200 million

Ct. 2929 (2006); *Schering-Plough Corp., Upsher-Smith Labs., and American Home Products Corp.*, Dkt. No. 9297 (Apr. 2, 2002) (consent order as to American Home Products).

²¹ *FTC v. Cephalon, Inc.*, No. 08-cv-2141 (E.D. Pa. complaint filed Feb. 13, 2008), available at <http://www2.ftc.gov/os/caselist/0610182/080213complaint.pdf>.

collectively to settle patent litigation with four manufacturers of generic versions of Provigil to induce them to abandon their plans to sell generic Provigil for six years, until 2012. Cephalon's CEO observed shortly after entering these agreements: "We were able to get six more years of patent protection. *That's \$4 billion in sales that no one expected.*"²² Cephalon has asked the court to dismiss the case based on the permissive standard adopted by appellate decisions in other circuits. There has been no action on the motion to dismiss, which was fully briefed in June 2008. In the meantime, Cephalon has instituted two price increases on Provigil since the Commission filed its complaint.

In the second case, the Commission has challenged patent settlement agreements in which Solvay Pharmaceuticals, Inc. agreed to pay generic drug makers Watson Pharmaceuticals, Inc. and Par Pharmaceutical Companies, Inc., to delay generic competition to Solvay's branded drug AndroGel.²³ According to the February 2009 complaint, Solvay promised payments of hundreds of millions of dollars collectively to induce the generic companies to abandon their patent challenges and agree to forbear bringing a generic AndroGel product to market for nine years, until 2015. Although the case was filed in California, where one of the four defendants is headquartered, at the request of the defendants the California court transferred the case to the Northern District of Georgia. As a result, the law of the Eleventh Circuit, which issued the *Schering* decision, will govern the case.

Despite the Commission's ongoing antitrust enforcement efforts to stop pay-for-delay settlements, the appellate court decisions upholding their legality have prompted a resurgence in

settlements in which the parties settle with a payment to the generic company and an agreement by the generic company not to market its product. Settlements with payments to the generic patent challenger had essentially stopped in the wake of antitrust enforcement by the FTC, state attorneys general, and private parties during 2000 through 2004. But the recent appellate court decisions have triggered a disturbing new trend.

After a five-year hiatus in payments to generics following the initiation of Commission enforcement actions aimed at pay-for-delay settlements, they have become commonplace.²⁴ By the end of fiscal year 2005, the year of the Eleventh Circuit's decision in *Schering*, there were three such settlements. In the years after the *Schering* and *Tamoxifen* rulings came out, there were significantly more. The staff's analysis of settlements filed under the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 during the fiscal year ending in September 2007 found that almost half of all of the final patent settlements (14 of 33) involved compensation to the generic patent challenger and an agreement by the generic firm to refrain from launching its product for some period of time.

Moreover, the findings concerning settlements with first generic filers – that is, settlements that can serve to block FDA approval of later applicants²⁵ – are even more striking. Since 2005, 69 percent (22 of 32) of the settlements with first generic filers involved a payment to the generic challenger and a restriction on generic entry.²⁶

B. The profitability of delaying generic entry means that these agreements will become more prevalent

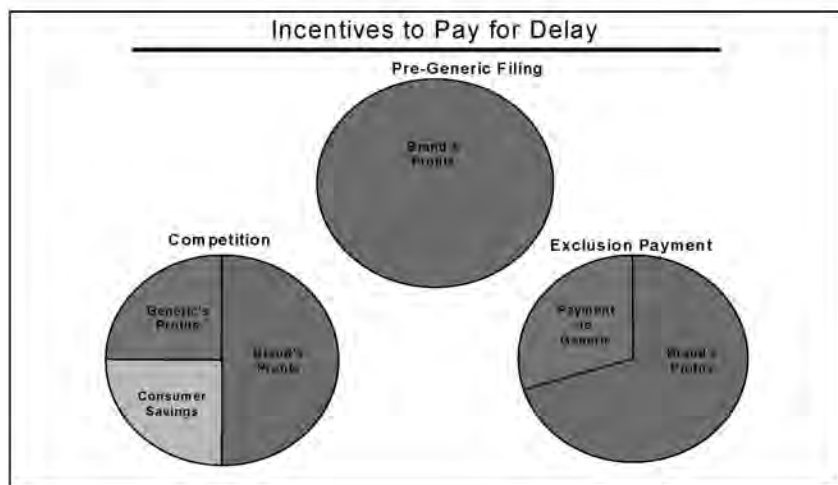

In the current legal climate, there is every reason to expect the upsurge in such settlements to continue, and early entry of generics under Hatch-Waxman to decline. Why? Because pay-for-delay settlements are highly profitable for both brand-name and generic firms. If such payments are permissible, companies have compelling incentives to use them.

Although patent challenges have the potential for substantial consumer savings, the competitive dynamic between brand-name drugs and their generic equivalents creates an incentive for brand and generic manufacturers to conspire to avoid competition and share the resulting profits. The reason is simple: in nearly any case in which generic entry is contemplated, the profit that the generic anticipates will be much less than the amount of profit the brand-name drug company stands to lose from the same sales. This is because the generic firm sells at a significant discount off the price of the brand-name product. The difference between the brand's loss and the generic's gain is the money consumers save.

Consequently, it will typically be more profitable for both parties if the brand-name manufacturer pays the generic manufacturer – an amount less than the brand-name manufacturer would have lost and more than the generic would have gained – to settle the patent dispute and the latter agrees to defer entry. As is illustrated below, by eliminating the potential for competition, the parties can share the consumer savings that would result if they

<http://www.ftc.gov/os/2008/05/mmaact.pdf>; Bureau of Competition Report, Federal Trade Commission, *Agreements Filed with the Federal Trade Commission under the Medicare Prescription Drug, Improvement, and Modernization Act of 2003: Summary of Agreements Filed in FY 2006: A Report by the Bureau of Competition* (Apr. 2007), available at <http://www.ftc.gov/reports/mmaact/MMAreport2006.pdf>; Bureau of Competition Report, Federal Trade Commission, *Agreements Filed with the Federal Trade Commission under the Medicare Prescription Drug, Improvement, and Modernization Act of 2003: Summary of Agreements Filed in FY 2005: A Report by the Bureau of Competition* (Apr. 2006), available at <http://www.ftc.gov/os/2006/04/fy2005drugsettlementsrpt.pdf>.

were to compete. In other words, these settlements are harmful because the parties are resolving their dispute at the expense of consumers. Although both the brand-name companies and generic firms are better off with such settlements, consumers lose the possibility of earlier generic entry, which may occur either because (1) the generic company would have prevailed in the lawsuit (as noted in Section I.C., *infra*, the FTC's Generic Drug Study found generic challengers enjoyed a success rate in excess of 70 percent), or (2) because the parties would have negotiated a settlement with an earlier entry date absent the payment (i.e., the payment induced the generic to delay entry longer than it otherwise would have). Instead, consumers pay higher prices because such early generic entry is delayed. By eliminating the potential for competition, the parties can share the consumer savings that would result if they were to compete.

C. Pay-for-delay settlements impose enormous costs on consumers and the health care system

Generic drugs play a crucial role in containing rising prescription drug costs by offering consumers therapeutically-identical alternatives to brand-name drugs at a significantly reduced cost. Although it is well known that the use of generic drugs – which are priced 20 to 80 percent or more below the price of the branded drug²⁷ – provides substantial savings, what is not so well known is the important role that generic drug firms' patent challenges play in delivering savings to consumers.

One of the key steps Congress took in the Hatch-Waxman Act to promote more rapid introduction of generics was establishing special rules and procedures to encourage firms seeking approval of generic drugs to challenge invalid or narrow patents on branded drugs. Experience has borne out the premise of the Hatch-Waxman patent challenge framework: that many patents, if challenged, will not stand in the way of generic entry,²⁸ and that successful challenges can yield enormous benefits to consumers. An analysis of Federal Circuit decisions from 2002 through 2004 in which the court made a final ruling on the merits of a pharmaceutical patent claim (validity, infringement, or enforceability) found that the generic

²⁷ See Congressional Budget Office, *How Increased Competition from Generic Drugs Has Affected Prices and Returns in the Pharmaceutical Industry* (July 1998), available at <http://www.cbo.gov/showdoc.cfm?index=655&sequence=0> (hereinafter "CBO Study").

²⁸ See, e.g., *Aventis Pharma S.A. v. Amphastar Pharms., Inc.*, No. 2007-1280, 2008 WL 2039065 (Fed. Cir. May 14, 2008) (patents covering blood-clotting drug Lovencox held unenforceable), *petition for cert. filed*, 77 U.S.L.W. 3441 (U.S. Jan. 23, 2009) (No. 08-937); *Aventis Pharma Deutschland GmbH v. Lupin Ltd.*, 499 F.3d 1293 (Fed. Cir. 2007) (patent covering high blood pressure drug Altace found invalid); *Daiichi Sankyo Co., Ltd. v. Apotex Inc.*, 501 F.3d 1254 (Fed. Cir. 2007) (patent covering method of treating ear infections with ofloxacin held invalid); *Pfizer, Inc. v. Apotex, Inc.*, 480 F.3d 1348 (Fed. Cir. 2007) (patent covering hypertension drug Norvasc held invalid); *SmithKline Beecham Corp. v. Apotex Corp.*, 439 F.3d 1312 (Fed. Cir. 2006) (product-by-process patent covering anti-depressant drug Paxil was invalid); *Alza Corp. v. Mylan Labs., Inc.*, 464 F.3d 1286 (Fed. Cir. 2006) (claims of patent related to extended release urinary incontinence drug Ditropan XL held invalid and not infringed).

challengers had a success rate of 70 percent.²⁹ The FTC's study of all patent litigation initiated between 1992 and 2000 between brand-name drug manufacturers and generic applicants found that when cases were litigated to a decision on the merits, the generics prevailed in cases involving 73 percent of the challenged drug products.³⁰ Many of these successes involved blockbuster drugs and allowed generic competition years before patent expiration.³¹ Indeed, generic competition following successful patent challenges involving just four major brand-name drugs (Prozac, Zantac, Taxol, and Platinol) is estimated to have saved consumers more than \$9 billion.³²

These cost savings are lost, however, if branded drug firms are permitted to pay a generic applicant to abandon challenging the brand, thereby deferring entry. So are the savings to the federal government, which accounted for an estimated 31 percent of the \$235 billion

³² *Generic Pharmaceuticals Marketplace Access and Consumer Issues: Hearing Before the Senate Commerce Comm.*, 107th Cong. (Apr. 23, 2002) (statement of Kathleen D. Jaeger, President & CEO, Generic Pharmaceutical Ass'n) at 12, available at http://frwebgate.access.gpo.gov/cgi-bin/getdoc.cgi?dbname=107_senate_hearings&docid=f:90155.pdf.

spent on prescription drugs in 2008, a share that is expected to rise to 40 percent by 2018.³³ Many of the top-selling prescription drugs in the United States – including such blockbusters as the asthma/allergy drug Singulair, the deep vein thrombosis (blood clot) and pulmonary embolism treatment Lovenox, and the schizophrenia, bipolar, and depression drug Abilify – are currently the subject of patent challenges by generic firms seeking to enter the market under the provisions of the Hatch-Waxman Act. The prospective cost savings to consumers and taxpayers from such challenges is enormous, to the extent that they lead to early, non-infringing generic entry. But given the lenient case law in some circuits, the parties have a strong economic incentive to enter into highly profitable anticompetitive settlements that deprive consumers of the benefit of low-cost, non-infringing generic drugs.

Prozac provides a telling example of what will be lost if brand and generic companies can enter pay-for-delay settlements. In the course of the Prozac patent litigation, the generic challenger reportedly asked to be paid \$200 million to drop its patent challenge. The brand company rejected the idea, stating that such a settlement would violate the antitrust laws.³⁴ The generic ultimately won that patent litigation, and consumers – as well as federal and state governments – saved over two billion dollars.³⁵ Under the legal standard articulated in the *Schering*, *Tamoxifen*, and *Cipro* cases, however, the proposed settlement would have been legal and profitable for both parties. The parties would have had every reason to enter the agreement,

³⁵ Kirchgassner & Waldmeir, *supra* note 3.

generic Prozac entry would not have occurred until much later, and consumers and others would have paid the price.

D. Permissive legal treatment of pay-for-delay settlements undermines the Hatch-Waxman Act

The problem of pay-for-delay patent settlements has arisen in – and, to the FTC’s knowledge, only in – the context of the special statutory framework that Congress created with the Hatch-Waxman Act. Congress intended that the Hatch-Waxman Act would “make available more low cost generic drugs,” while fully protecting legitimate patent claims.³⁶ The special rules that apply in this area were designed to balance the two policy goals that are of critical significance in the pharmaceutical industry: speeding generic drugs to market and maintaining incentives for new drug development. Legislative action concerning pay-for-delay settlements can be tailored to the special circumstances of pharmaceutical patent settlements and help to ensure that this unique framework works as Congress intends.

Hatch-Waxman was designed to give generic companies an incentive to challenge weak patents and to compete, not to take money in exchange for sitting on the sidelines. But as one of the authors of the Act, Congressman Henry Waxman, has observed, because of pay-for-delay settlements, the law “has been turned on its head.”³⁷

The reasoning underlying these permissive appellate court rulings underscores the need for action by Congress. These decisions reflect judicial judgments about the policy choice that Congress made in Hatch-Waxman. For example, the Eleventh Circuit’s *Schering* decision –

³⁶ H.R. Rep. No. 857, 98th Cong., 2nd Sess., Pt. 1 (1984), as reprinted in 1984 U.S.C.C.A.N. 2647, 2661.

³⁷ Cheryl Gay Stolberg et al., *Keeping Down the Competition; How Companies Stall Generics and Keep Themselves Healthy*, N.Y. TIMES, July 23, 2000, at A11 (quoting Rep. Waxman), available at <http://www.nytimes.com/2000/07/23/us/keeping-down-competition-companies-stall-generics-keep-themselves-healthy.html?sec=&spon=&pagewanted=all>.

which opined that the Hatch-Waxman framework Congress created gave generic firms “considerable leverage in patent litigation,” and could therefore “cost Schering its patent”³⁸ – emphasized that its decision was based on “policy.”³⁹ Congress, however, is the body with the responsibility to set patent policy. Striking the balance so as to promote innovation while also promoting generic entry is fundamentally a legislative choice. Accordingly, it is fitting that if courts have disturbed the balance Congress struck in Hatch-Waxman between patents and competition, Congress should address the use of exclusion payments in drug patent settlements to correct that balance.

E. Legislation is likely to be swifter and more comprehensive than litigation

While the Commission’s enforcement activities are continuing, we recognize the time and uncertainty involved in litigation challenges to anticompetitive settlements. The Commission’s *Provigil* case has been stalled at the district court level for over a year without progress, thus illustrating the delay that can arise in litigation. Although the Commission will continue to be vigilant in this area, litigating another case to conclusion will take years, and the outcome of such litigation is uncertain given the *Schering*, *Tamoxifen*, and *Cipro* decisions. In any event, such litigation will provide little relief for those harmed in the interim by not being afforded the option of a generic alternative. The cost to consumers, employers, and government programs will be substantial. Legislation could provide a speedier and more comprehensive way to address this pressing concern.

³⁸ 402 F.3d at 1074.

³⁹ *Id.* at 1076.

II. The Arguments Against Barring Exclusion Payments Are Contradicted by Experience in the Market

In the debate over legislation to ban pay-for-delay settlements, certain arguments are routinely offered by supporters of these settlements: (1) such settlements typically allow generic entry before patent expiration and therefore benefit rather than harm consumers; (2) it is virtually impossible to settle Hatch-Waxman patent cases without payments to the generic challenger; and (3) barring such payment to generic firms will mean that fewer generic firms will undertake patent challenges. In the Commission's view, these arguments overlook market realities.

First, the suggestion that pay-for-delay patent settlements are procompetitive – by guaranteeing generic entry prior to the expiration of the disputed patent – is contrary to the Commission's experience. The *Provigil* case is a good example. The branded drug company, Cephalon, touted the “obvious benefits and efficiencies” of its settlement to the court on the ground that the settlement “permitted the [g]enerics to enter the market three years prior to the expiration of the [] patent.”⁴⁰ But Cephalon has told a very different story to its investors. Discussing its plan to switch sales from *Provigil* to a follow-on product, Cephalon's CEO stated, “if we do our job right . . . the *Provigil* number in 2012 [the date the settlement agreement permit the generics to enter the market] that will be genericized will be very, very small.”⁴¹ As this example reveals, that a settlement permits generic entry before patent expiration in no way ensures that consumers will benefit from the settlement.

⁴⁰ Ceph. Mem. in Support of its Mtn. to Dismiss at 1, *FTC v. Cephalon, Inc.*, No. 08-2141 (E.D. Pa. Mem. filed May 5, 2008).

⁴¹ Cephalon Q4 2008 Earnings Call Transcript at 9 (Feb. 13, 2009), available at <http://sckingalpha.com/article/87859-ccphalon-inc-q2-2008-earnings-call>.

Second, experience does not support the contention that Hatch-Waxman cases can typically only be settled by the transfer of value from the patent holder to the generic challenger. On the contrary, the settlement data that the FTC has for the period from 2000 through 2004 indicate that parties can and do find other ways to settle cases. During that period of successful Commission enforcement, pay-for-delay settlements essentially stopped. But patent settlements – using means other than exclusion payments – continued to occur. In less than five years, there were at least as many settlements as there were in the seven years in which pharmaceutical companies were settling litigation with payments and restrictions on generic entry.⁴² Parties simply found different ways to resolve their disputes, presumably on the basis of the relative strength of their cases. And patent settlements will continue if Congress enacts legislation that prohibits anticompetitive payments in settlements of Hatch-Waxman patent cases.

Third, the argument that banning pay-for-delay settlements will discourage generic drug companies from mounting patent challenges overlooks one of the fundamental premises of the Hatch-Waxman Act: the Congressional judgment that weak patents should not create unwarranted barriers to competition from generic drugs. The Hatch-Waxman Act implements that judgment by establishing special rules and procedures when a generic firm seeks approval to market its product before all relevant patents have expired. Congress designed the regulatory framework to facilitate generic entry; patent challenges are not an end in themselves. The measure of success of the framework Congress devised is not the number of patent challenges filed, but the extent to which such challenges actually deliver savings to consumers. Permitting

⁴² The agency lacks data for the approximately three year period between the end of the Generic Drug Study in 2000 and the beginning of the MMA reporting period in 2003. It is likely that there are additional settlements that occurred during this period for which the agency does not have information.

patent settlements in which the parties share monopoly profits preserved by delaying generic competition may increase the number of patent challenges that are filed, but it does not promote consumer access to generic drugs or cost savings.

III. The Legislative Remedy

The Commission believes that certain principles are important in crafting the precise form and scope of a legislative remedy to the pay-for-delay settlements. The fundamental antitrust concern underlying such settlements is the sharing of monopoly profits that are preserved by an agreement not to compete, whatever form the compensation to the generic takes. Thus, legislation must be sufficiently broad to encompass the various ways that a branded firm may share its profits with the generic, including not only the ways we have seen to date, but also those that may arise in the future. At the same time, legislation should be designed to avoid unwarranted deterrence of settlements that present no competitive problem.

H.R. 1706 embodies these principles. It broadly proscribes settlements in which a generic firm receives “anything of value” and agrees to refrain from selling the product, while also providing two mechanisms to prevent settlement avenues from being unduly limited and avoid chilling procompetitive settlements. First, section 2(b) contains express exclusions from the general prohibition on settlements in which the generic firm receives something of value and agrees to refrain from selling its product. Second, section 3 provides flexibility by authorizing the FTC to adopt rules to exempt other agreements from the general prohibition.

In sum, H.R. 1706 offers a straightforward means to quickly combat anticompetitive conduct that is pervasive and costly to consumers, while also providing flexibility to protect procompetitive arrangements.

Conclusion

Thank you for this opportunity to share the Commission's views. The Commission looks forward to working with the Subcommittee to protect consumers from anticompetitive pay-for-delay settlements that cost consumers and the federal government billions of dollars.

Mr. JOHNSON [continuing]. If you could go ahead and wrap
up—
Mr. FEINSTEIN. I just did. I have completed it. Thank you.
Mr. JOHNSON. Thank you.
Ms. Bresch, your turn, ma'am.

TESTIMONY OF HEATHER BRESCH, EXECUTIVE VICE PRESIDENT, CHIEF OPERATING OFFICER, MYLAN INCORPORATED, CANONSBURG, PA

Ms. BRESCH. Thank you, Chairman Johnson, Ranking Member Coble, and Members of the Judiciary Subcommittee on Courts and Competition Policy.

In particular, thank you, Chairman Conyers, for inviting us today to attend.

My name is Heather Bresch, and I am chief operating officer of Mylan, Incorporated. We are the largest U.S.-based generic pharmaceutical manufacturer and the third largest generic pharmaceutical company in the world.

In addition to my 17 years with Mylan, I have served as both chairman and vice chairman of the Generic Pharmaceutical Association, and I am currently a member of the executive committee of the Generic Pharmaceutical Association.

I am pleased to be here this morning and fully appreciate the concerns that both Congress and the Federal Trade Commission regarding the number and type of patent settlements between brand and generic pharmaceutical manufacturers in recent years.

When it comes to settlements, we believe Congress needs to look no further than the use and abuse of authorized generics by brand manufacturers. In fact, if authorized generics had been addressed in the 2003 Medicare Modernization act, we probably wouldn't be here today.

We believe that the increase in settlements in recent years is directly related to the increase in the use of authorized generic by brand manufacturers. Mylan contends that barring the launch of A.G.s during the 180-day exclusivity period would simply resolve your concerns relative to settlements and at the same time restore the intended balance to Hatch-Waxman.

In addition, the FTC has indicated that they will soon release the results of a comprehensive study of settlements in relation to authorized generics. We are optimistic that their findings will validate our contention and demonstrate that authorized generics and patent settlements go hand in hand.

By way of background, 25 years ago, Hatch-Waxman act of 1984 created a balance between encouraging innovation and promoting competition. The act provided brand companies numerous incentives, including patent extensions and other protections.

The major incentives provided to generic companies who undertook the risk and expense of challenging questionable brand patents with 180-day period of marketing exclusivity. And for 25 years, ever since that act was passed, generic manufacturers have been fighting brand company tactics that continue to disrupt the critical balance that Hatch-Waxman provided.

One such tactic, known as evergreening, resulted in a 64-month stay for the blockbuster depression product Paxil, preventing any competition during that time. This lucrative loophole and several others were closed by MMA in 2003. Since then, brand companies have been limited to one 30-month stay per product.

Consequently, brands accelerated the use and abuse of authorized generics during the exclusivity period to counteract MMA and have continued to upset the balance of Hatch-Waxman. It is inter-

esting to note that brand companies don't release an authorized generic until the first true generic begins its 180 days of exclusivity. Furthermore, A.G.s can all but eliminate the incentive for a generic filer to challenge frivolous or invalid patents, invest in the R&D necessary to produce an affordable generic product, and accept the risk of expensive patent litigation.

The intent of Hatch-Waxman was clear: 180-day exclusivity meant one generic on the market for 180 days, but brand manufacturers found a loophole in the statute that allows them to market a generic to compete during that 180-day period.

U.S. District Court Judge Irene Keeley said on the record that the brands' ability to market authorized generics during this period is a gaping black hole in the law. She also stated that there needed to be a legislative fix, and a fast one.

Since 2003, brand companies can use the threat of an authorized generic on almost every product facing patent litigation. This tactic gave the brand companies the powerful tool that all but forces generic companies to settle. It changed the dynamic of the negotiation in every sense.

As a result, brands have eliminated the major benefit a generic manufacturer gained from Hatch-Waxman. As it stands, generic companies are forced to negotiate to get it back through settlements.

I can sit here today and tell you unequivocally that Mylan has settled patent litigation that may not have settled if not for the threat of authorized generics being launched during the 180-day period. And more broadly, in 2008, the FTC concluded that almost 80 percent of reported patent settlements involved an authorized generic during the 180-day period.

As I mentioned in my opening, the FTC has indicated that they will be realizing the results of a study on authorized generics this month. We are confidently optimistic that these results will reveal a direct link from settlements to authorized generics and that this link will demonstrate that the use of authorized generics during the exclusivity period have a long-term detrimental effect on generics overall.

We hope that this study will make it easier for Congress to take action and restore the proper balance to Hatch-Waxman by prohibiting the introduction of authorized generics during the 180 days. Unless and until authorized generic problem is resolved, the patent settlement issue cannot rationally be discussed.

In summary, we believe that Congress must ensure timely access to affordable generic medications as offered to patients when patents are invalid, unenforceable, or not infringed. This requires the restoration of the incentive of a true 180-day marketing exclusivity period that will enable generic companies to continue to challenge patents and appropriately pursue worthy products.

Barring A.G.s during the 180 will also re-establish a level playing field for generic companies that they consider settlement options with a brand company during patent litigation without the threat of a looming authorized generic. Imposing certain restrictions on the ability of generic companies to settle expensive litigation without providing a ban on A.G.s will completely upend the

balance between innovation and competition and result in further delays of affordable generic products for the American consumer.

It is more important today than ever to close this loophole, because authorized generics will only be exacerbated when generic biologics become available.

I want to thank the Subcommittee for your time and interest in making sure all patients have access to affordable and safe generic pharmaceuticals. And, as always, Mylan is willing to work with Congress and the FTC to restore balance to Hatch-Waxman.

I would be happy to answer any questions.

[The prepared statement of Ms. Bresch follows:]

PREPARED STATEMENT OF HEATHER BRESCH

Testimony of

Heather Bresch

Chief Operating Officer
Mylan Inc.

Pay to Delay:

Are Patent Settlements That Delay Generic Drug Market Entry Anticompetitive?

**United States House of Representatives
Committee on the Judiciary, Subcommittee on Courts and Competition Policy
2141 Rayburn House Office Building**

**Washington, D.C.
June 3, 2009**

Thank you Chairman Johnson, ranking Member Coble, and members of the Judiciary Subcommittee on Courts and Competition Policy. In particular, thank you Chairman Conyers for inviting us to attend today. My name is Heather Bresch, and I am the Chief Operating Officer of Mylan Inc. For nearly 50 years, Mylan has built a legacy of manufacturing high quality, affordable pharmaceuticals. We are the largest U.S.-based generic pharmaceutical manufacturer and the third largest generics and specialty pharmaceutical company in the world. One out of every 13 prescriptions dispensed in the U.S. – brand name or generic – is a Mylan product. Additionally, Mylan has consistently been recognized by the FDA and by the pharmacy community for excellence in quality and service.

In addition to my 17 years with Mylan, I have served as both Chairman and Vice Chairman of the Generic Pharmaceutical Association (GPhA), and I am currently a member of the association's Executive Committee. GPhA represents more than 100 generic manufacturers and distributors of finished generic products as well as manufacturers and distributors of bulk active pharmaceutical chemicals.

Generic products are now used to fill nearly 70 percent of all prescriptions dispensed across the country but account for only 16 percent of all dollars spent on prescription medicines. A recent study conducted by IMS Health revealed that using generic pharmaceuticals saved the American health care system more than \$734 billion in the last decade (1999-2008), with approximately \$121 billion in savings in 2008 alone. These savings directly benefit consumers, businesses, and state and federal government agencies.

Mr. Chairman, our country is facing a crisis in rising healthcare costs and the generic pharmaceutical industry represents one of the few proven and successful solutions to contain those costs. President Obama, in his remarks on reforming the health care system stated:

When it comes to health care spending, we are on an unsustainable course that threatens the financial stability of families, businesses and government itself...

Over the last decade, Americans have seen their out-of-pocket expenses soar, while health care premiums doubled at a rate four times faster than wages. Today, half of all personal bankruptcies currently stem from medical expenses.

In 2007, Obama emphasized the importance generics would have in his future administration when he said:

My administration will look carefully at key industries to ensure that the benefits of competition are fully realized by consumers. Americans, for example, spend billions of dollars each year on drugs. Competition from generic manufacturers has the potential to reduce these costs significantly, or at least prevent these costs from ballooning further.

The generic drug industry plays a key role in reducing health care costs. The entry of safe and effective generic medicines adds competition to the marketplace and reduces the costs of medicines dramatically. In this current economic environment it is therefore even more critical to ensure timely access to generic pharmaceuticals. I am pleased to be here today to discuss critical issues that relate to timely access to affordable generic medicines and how these issues relate to patent settlements.

A BRIEF HISTORY OF HATCH-WAXMAN

By way of background, *Hatch-Waxman* – officially “The Drug Price Competition and Patent Term Restoration Act of 1984” – reflected an attempt by Congress to strike a balance between two policy objectives: to incentivize name-brand pharmaceutical firms to make the investments necessary to research and develop new drug products and to enable competitors to bring lower-cost, bioequivalent and therapeutically equivalent generic versions of those drugs to market. *Hatch-Waxman* is designed to both reward innovation and encourage the development of affordable health care. When the balance is disturbed, the system is jeopardized, and consumers, the government and taxpayers suffer financially.

On the branded pharmaceutical side of the scale, *Hatch-Waxman* protects intellectual property in a variety of ways. It provides the means for innovators to restore up to five years of patent life to compensate for time the product underwent regulatory review at the FDA. Congress has provided branded pharmaceutical companies an additional five years of data exclusivity for new chemical entities; a supplement of three years of data exclusivity for clinical trials; six months marketing exclusivity for pediatric studies; and, an automatic 30-month stay of generic approvals

to resolve patent disputes.

On the generic pharmaceutical side of the scale, *Hatch-Waxman* streamlined the generic drug approval process and provided 180 days of market exclusivity to incentivize generic manufacturers to challenge questionable or frivolous patents held by brand manufacturers that essentially protect monopolies and prevent affordable medications from reaching the market. The marketing exclusivity period allowed generic companies to gain financial resources necessary to reinvest and continue to develop additional affordable and high quality generic products.

In the early 2000s, branded pharmaceutical companies began to exploit certain legislative loopholes in *Hatch-Waxman*. One such loophole was a practice known as 'evergreening,' a tactic which is aptly demonstrated by a brand company's gaming of the system with tactics relating to the depression/anxiety product Paxil®.

The FDA lists drug products approved on the basis of safety and effectiveness in its publication "Approved Drug Products with Therapeutic Equivalence Evaluations," more commonly known as the "Orange Book." If another pharmaceutical company believes a patent listed in the Orange Book is invalid or not infringed by its product, the patent must be challenged by the generic company by filing a Paragraph IV certification. If the brand company sues the generic applicant for infringement, an automatic 30-month preliminary injunction or stay is triggered.

In the case of Paxil, the brand company successfully timed the issuance of multiple patents that resulted in successive 30-month stays that significantly delayed the introduction of a bioequivalent generic version of the product and kept it from reaching patients who suffer from anxiety and/or depression. The first stay of FDA approval expired in November 2000, but the FDA was not able to approve a generic version of Paxil until September 2003 due to four successive and overlapping statutory stays of approval. The brand company had annual sales in excess of \$2 billion and these successive and overlapping stays resulted in an almost three-year delay before a more affordable generic product could be offered to consumers.

While Congress put an end to the evergreening practice in 2003 with the passage of the *Medicare Modernization Act* (MMA), brand companies had moved on to new tactics to extend their monopolies. The most notorious of these tactics is the use of so-called authorized generics. The practice has become so prevalent that authorized generics are factored in at every step of a company's decisions regarding each product that could potentially find its way or does find its way into a company's pipeline. Authorized generics affect decision making and the availability of capital needed for research and development and litigation costs required to bring a new generic product to the American market. Since the presence of an authorized generic is assumed on the launch of every product, a company must carefully consider the impact of an authorized generic when it determines what products to develop, how to pursue litigation and when it evaluates a potential litigation settlement.

AUTHORIZED GENERICS

Authorized generics are, in fact, the same exact products as their branded counterparts made on the same production lines with the exact same ingredients, but before packaging, they are given a different label. Same product, same bottle, different label. Brand companies do not release authorized generics until the first true generic begins its 180 days of statutory exclusivity. This practice can all but eliminate the incentive for a generic filer to identify frivolous or invalid patents, invest in the research and development necessary to produce a bioequivalent and affordable generic product and accept the risk of expensive patent litigation. As generic companies, we simply assume that an authorized generic will be launched by the brand company upon release of our true generic, and we assume that our earned 180 days of marketing exclusivity will be significantly diminished.

Let me be very clear: Mylan is not opposed to authorized generics in and of themselves. Our issue lies only in the marketing of authorized generics during the 180 days of exclusivity as provided under *Hatch-Waxman*. Following the 180 days granted to the first generic filer, we recognize and respect the right of any company with an FDA-approved product, including the brand company, to compete in the generic marketplace. The issue is *when* the authorized generic is brought to market.

I might add that it is the timing of the introduction of the authorized generic that has caught the attention of the Federal Trade Commission (FTC) and is being examined in their pending study.

The words of several brand pharmaceutical CEOs best demonstrate their motives.

In an April 2003 press release, GlaxoSmithKline announced an authorized generic agreement for Paxil®. The agreement prevented the authorized generic from becoming available until “another generic version fully substitutable for Paxil becomes available.” In other words, the more affordable authorized generic was prohibited from launching until the product of a generic filer with 180 days of exclusivity was launched.

In December 2003 in a Pink Sheet article, Eli Lilly CEO Sidney Laurel was quoted saying that systematically launching authorized generics each time a patent expires would mean the brand industry could “truly eliminate the incentive in the calculation that generic companies would make.”

In a February 2004 earnings conference call, GlaxoSmithKline CEO J.P. Garner said, “*The idea was somebody has a six-month exclusivity, but we are a king maker; we can make a generic company compete during [the 180-day exclusivity].*”

“King maker” doesn’t sound like the competitive balance intended by Congress when it enacted *Hatch-Waxman*.

Professors Aidan Hollis and Bryan Liang prepared a study in 2006 on the effects of authorized generics, “An Assessment of Authorized Generics: Consumer Effects and Policy Issues.” [http://www.gphaonline.org/sites/default/files/GPhA_AG_Study.pdf] They assessed claims that authorized generics have positive effects on consumers by allegedly reducing prices on drug products immediately after generic entry during the 180-day exclusivity period. Professors Hollis and Liang found that in fact authorized generics had a negligible effect on prices during

this period. More importantly, they determined that the use of authorized generics diminishes the incentive for generic companies during the 180-day exclusivity period which in turn reduces the incentives generic companies have to challenge invalid patents and develop non-infringing products. They found that authorized generics will lead generic firms to be less aggressive in competing against brand companies and the ultimate losers will be consumers and taxpayers who bear the burden of healthcare costs.

For the past three years, the FTC has been studying the effect of authorized generics in the marketplace. No study has been more anxiously awaited by the generic industry, which has endured enormous detrimental effects from the practice of authorized generics being released during the 180-day exclusivity period. We understand this study will be released in June, and we expect the results to address the immediate negative impact of authorized generics during the 180 days on consumers and the long-term detrimental effects of authorized generics on patent settlements.

In fact, Members of Congress have recognized the detrimental effects of authorized generics during the 180-day exclusivity period and in January House Representative Emerson (R-MO) together with Representatives Berry (D-AR), Moore (D-KS), and Wamp (R-TN) reintroduced bipartisan legislation to prohibit the marketing of authorized generics (H.R. 573). A similar bill has been introduced in the Senate (S. 501) by Senator Rockefeller (D-WV) along with Senators Brown (D-OH), Inouye (D-HI), Kohl (D-WI), Leahy (D-VT), Schumer (D-NY), Shaheen (D-NH) and Stabenow (D-MI). Mylan applauds these Members for recognizing that prohibiting authorized generics is an important part of the solution to the problem of rising health care costs in America.

When crafted, *Hatch-Waxman* offered a careful and thoughtful balance. It promoted innovation and provided an incentive to companies that expend significant resources to bring generic drugs to market, ensuring that Americans have timely access to affordable medicines. When a brand company exploits a loophole in *Hatch-Waxman*, as they certainly do with authorized generics, they artificially extend a patented monopoly. Everyone suffers and the carefully crafted balance disintegrates. Had authorized generics been addressed by Congress in MMA in 2003, it is

unlikely we would be here today discussing patent settlements.

PATENT SETTLEMENTS

Drug patent settlements have recently come under increased scrutiny by the FTC and Congress. The FTC appears to be concerned with settlements that involve a payment of money in exchange for a generic company accepting a fixed date of entry to the market. However, it is important to remember that patent settlements, in and of themselves, do not have a negative impact on competition. In fact, a settlement involving the breast cancer treatment Tamoxifen® allowed a generic version to enter the market nine years before the date the relevant patent expired.

In almost every other type of litigation, settlement is encouraged. It is an efficient way to resolve disputes and not impact court resources. The settlement option is particularly important to generic companies attempting to challenge brand patents. The development of a product including the submission of an abbreviated new drug application is expensive. Patent litigation results in additional costs, which can escalate depending on the complexity of the product and patents at issue. Since these challenges are extremely costly and the outcomes of even the best cases are uncertain, companies need the ability to settle cases.

The process for bringing a generic product to market is not as simple as some may think. In fact, the process starts many years before the affordable generic medication becomes available to a patient. There are many market factors that a company considers before deciding to invest in the necessary research and development for a particular product. These factors include the impact of delay tactics and manipulated loopholes that brand companies employ. These tactics are introduced throughout the entire generic development process, including during patent settlement discussions. The fact that a brand company is almost certain to launch an authorized generic, or at the very least threaten to launch one, means that the incentive to continue litigation is significantly weakened for the generic company.

As a result, brand companies have a much stronger bargaining position during patent settlement negotiations. Brand companies use authorized generics as a “trump card” to reduce generic

returns, even if the generic company believes it can invalidate the brand's patents. This leaves the generic company with limited bargaining power and little choice but to settle. This situation takes the power away from the generic company, the party that is best suited to determine how to get a generic product to the market.

In 2008, the FTC found that 78% of the reported patent settlements involved a restriction on the launch of an authorized generic during the period of the generic company's exclusivity. In essence, generic companies must settle in order to safeguard the exclusivity promised by Congress in 1984 by *Hatch-Waxman*.

The FTC has recognized the crucial role authorized generics play in settlement negotiations. FTC Commissioner Jon Leibowitz noted in a 2006 speech that:

The profits to be made in the 180-day exclusivity period are reduced substantially [by authorized generics], perhaps even cut in half. So the generic firm's calculus in the fight-versus-settle equation may now be more heavily weighted towards settling. Rather than gamble on winning in court, a generic may decide that a fixed entry date and guaranteed revenue stream is a better value than rolling the dice.

Some might suggest that a bright-line ban on patent settlements involving the receipt of anything of value apart from generic entry pre-patent expiry is required to protect consumers. However, this approach would eliminate many pro-competitive settlements and more specifically would make it illegal for a generic to secure what was intended by Congress in *Hatch-Waxman* – 180 days of *exclusive* market presence. Such a result is inconsistent with the purposes and intent of Congress in enacting the *Hatch-Waxman Act* in the first place. We urge Members of Congress to address all the considerations of patent settlements and to support legislation that would eliminate authorized generics during the 180-day exclusivity period.

In summary, we believe that Congress must ensure the timely access of affordable generic medications is offered to patients when patents are either invalid or not infringed. This requires the restoration of the incentive of the 180-day exclusivity period which will enable generic companies to challenge patents and appropriately pursue worthy patent cases. A prohibition on authorized generics during the 180-day exclusivity period will also re-establish a level playing

field for generic companies as they contemplate settlement with a brand company in patent litigation, thereby allowing the generic company to view settlement options without the threat of an authorized generic looming overhead. Taking away the ability for generic companies to settle expensive litigation without also providing a ban on authorized generics will be sure to result in further delays of affordable generic products for Americans.

I want to thank the subcommittee again for its time and interest in making sure all Americans have access to affordable, safe generic pharmaceuticals. As always, Mylan is willing to work with Congress and the FTC on these issues. I am happy to answer any questions you might have.

Mr. JOHNSON. Thank you, Ms. Bresch.
Mr. Kennedy, proceed.

TESTIMONY OF WILLIAM P. "BILL" KENNEDY, CHIEF EXECUTIVE OFFICER, ORLANDO, NEPHRON PHARMACEUTICALS CORPORATION, ORLANDO, FL

Mr. KENNEDY. Thank you, Mr. Chairman and Members of the Committee. My name is Bill Kennedy, and I am here to testify on behalf of our family-owned generic pharmaceutical business.

Our company manufactures sterile generic respiratory medication using state-of-the-art Blow-Fill-Seal technology. I am a pharmacist by education and have 43 years of experience in health care.

My recommendations to the Committee differ from a large-scale, publicly owned pharmaceutical company. I am here to show you how the American consumer can save 60 percent-plus of the cost of their prescribed medications.

In recent years, patent settlement agreements, sometimes referred to as reverse settlement agreements between the patent-holder of a drug and the first to file generic competitors have stifled competition. These agreements allow the brand manufacturer to continue selling its drug at or near the original branded price, while paying the first to file generic manufacturer not to distribute its product or either to offer an authorized generic product priced just beneath the branded drug, which would amount to approximately a 20 percent savings for the consumer on an average.

Large generic manufacturers often refer to their settlement agreements as pro-consumer. This is only slightly true, because, with a third or fourth competitor in the market, the generic drug pricing model takes over, allowing for pricing to reach truly pro-consumer levels.

We, the generic drug manufacturer, feel pro-consumer generic prices should be not 20 percent lower, but 60 percent to 80 percent lower than the brand name, once competition gets involved.

I will give you a couple examples of what I am speaking of. If you look on page four of my written statement, you will see that there was a drug that I competed against. The brand name was DuoNeb. When it first came off the patent, it only had the one competitor, and it was \$1.60 per dose. And patients took four vials per day. You see, it is a lot of money for 1 month.

After year 1, when you had two competitors in the market, the price dropped down to 87 cents. Okay, on year 2, we had three competitors who were in the market. The price dropped to 50 cents. Year 3, which we are in now—and we have four competitors in the market—the pricing is at 25 cents a vial and still dropping.

That is over an 80 percent savings since the time that we were able to get more than one generic competitor in the market. The prices do not start coming down drastically until you get two or three competitors in the market.

An example of how a small generic company like we are, where we cannot get into the market, would be a product by the name of levalbuterol, which—the product, which is very similar to a generic product that we manufacture, which is glyceemic albuterol.

The company that manufactures that, just this week, has entered into its third arrangement or third reverse settlement agreement

or whatever we decide to call it. I don't understand why a drug—and that is a very weak patent. I believe it is a weak patent, but all of the challengers that have gotten involved in a lawsuit with that patent have settled or there has been a reverse settlement, which means the product is still selling for approximately \$2 a vial when, if the patent was challenged, this product could easily drop into the, you know, 20 cent range, maybe the 15 cent range.

So it is almost impossible for the third and fourth filer in the generic pharmaceutical business, especially if you are a small manufacturer and just living off generics, have to get to market. Your patent has to be defeated before that third or fourth filer is going to come to market. And with the reverse settlement, that is very difficult to happen. So this company will have, if these reverse settlements hold up in court, they will have until 2013 to keep charging, you know, a high price.

So what does Nephron suggest that we do about this? We suggest that we eliminate the practice of patent settlement agreements, eliminate settlement agreements all together. Also, consider a major change in Hatch-Waxman by changing the first to file approach to a first to win the patent case without settling, which is much, much fairer. If you are going to put your money up to go to court and win the case, you should be allowed that time period.

And, third, I wish the legislators would consider increasing that window of opportunity of the 180-day period, which is 6 months, to a 1-year period. I feel like this will create a lot more competition in time to get people to challenge the patent.

I feel like, with the adoption of these recommendations, I believe it would be vital in helping to lower the cost of prescription medications in our health care system.

Thank you. And are there any questions I may answer?
[The prepared statement of Mr. Kennedy follows:]

PREPARED STATEMENT OF WILLIAM P. "BILL" KENNEDY

Prepared Statement of William P. (Bill) Kennedy
Co-Owner
Nephron Pharmaceuticals Corporation

Hearing on H. R. 1706, the *Protecting Consumer Access to
Generic Drugs Act of 2009*

Before the

US HOUSE OF REPRESENTATIVES
COMMITTEE ON THE JUDICIARY

On

June 3rd, 2009

Testimony of William P. (Bill) Kennedy, R.ph.
Co-Owner of Nephron Pharmaceuticals Corporation
Committee on the Judiciary
US House of Representatives
Hearing on H.R. 1706, The Protecting Consumer Access to Generic Drugs Act

June 3rd, 2009

Company Profile

Nephron Pharmaceuticals Corporation ("Nephron"), a family owned pharmaceutical manufacturing and sales company, has grown rapidly since it was purchased in 1991. Nephron utilizes state of the art Blow-Fill-Seal technology to manufacture sterile generic respiratory medications. Only four such facilities currently exist in the US. In spite of today's volatile economic times, Nephron is undergoing a 35 million dollar expansion to upgrade automation and technology at its Orlando, Florida manufacturing facility. Already a large employer, the company is adding specialized engineers and scientists to support its efforts to double manufacturing capacity of their life saving generic respiratory medications.

Introduction

Chairman Conyers, Ranking Member Smith and Members of the Committee, thank you for allowing me to testify before you today. My remarks are in support of H.R. 1706. I am here to show you how the American consumer can save 60% of the cost of their prescribed medications, if Congress will adopt my suggestions.

My name is Bill Kennedy and I purchased Nephron in the early nineties. I am a pharmacist by trade, and have 42 years of experience in healthcare. I have personally witnessed the struggles of the elderly and poor to afford their medications. I also remember the introduction of generic drugs, offering patients affordable therapeutic equivalents. As a generic drug manufacturer, it is my business practice to deliver low cost, high quality generic drugs to our customers. In fact, it is the hallmark of our company.

Multi-source generic drugs operate in a highly price competitive arena, while single source generic drugs or "authorized generics", rarely deliver significant price savings over their branded rivals. I propose that this committee supports H.R. 1706 to restore the incentives to generic drug makers in their challenge of patents with little or no legal basis, or medical benefit to consumers. Drugs with weak patents serve only to maintain artificially high prices for the American consumer. If Congress adopts H.R. 1706, competition and government savings that benefit all constituents and tax payers will prevail, restoring the public policy rationale originally envisioned by Hatch-Waxman.

The Challenge

A product pricing example from Nephron's recent history shows how the price of a generic drug rapidly drops in a competitive drug market. Nephron manufactures and sells a generic version of DuoNeb®, a widely used respiratory solution. As shown in the following diagram, this product was originally priced at approximately \$1.60 per dose as a single source, brand name drug. When the first authorized generic entered the market, the price dropped to approximately 0.87 cents. After the entrance of the third, fourth and fifth generic competitor, prices eroded to the current 0.25 cents range. In this case, consumers and the U.S. Government realized a cost reduction of more than 80% within three years after generic price competition began. Even though this price drop was steep and fairly rapid, this three year window could have been shortened, given the weak patent at introduction. By adopting H.R. 1706 Members of the Committee have the power to **accelerate that price drop by 2 or more years**; thus, saving billions of federal dollars and providing great benefit to the patient.

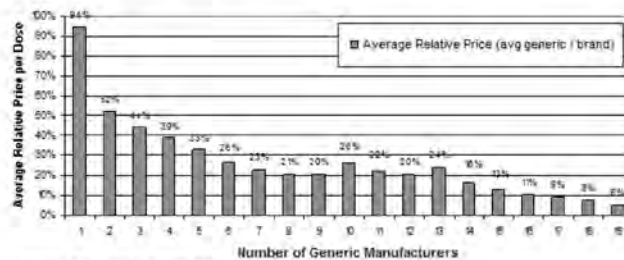

The Hatch-Waxman amendments to FDCA, include a feature called the "paragraph IV certification" filing. The filing offers generic drug manufacturers who challenge and successfully win a patent litigation case, a 180 day period to exclusively market a new generic drug before a brand drug is openly exposed to further generic competition. Filing a paragraph IV certification typically involves litigation between a patent holder and generic challenger. The 180 day exclusivity window serves as an incentive to the generic challenger to dispute a weak patent. This allows the potential winner of the challenge to recover the costs of litigation. Originally, the Hatch-Waxman amendments were intended to create additional access to generic drugs for the American consumer. In recent years, "patent settlement" agreements (sometimes referred to as "reverse settlement agreements"), between the patent holder of a drug and the first and second to file generic competitors have stifled competition. These agreements allow the brand manufacturer to continue selling its drug, at or near, the original branded price, while paying the first to file generic drug manufacturer not to distribute its product, or to offer its "authorized generic product", priced just beneath the branded drug. As a result, greatest consumer savings are delayed, and the American healthcare system, including Medicaid and Medicare, are forced to spend millions more on drugs.

If a prior party has filed a Hatch-Waxman paragraph IV certification application with the FDA, and entered into a corresponding patent settlement agreement with the patent

owner, then Nephron, as a third or fourth filer is unwilling to commit precious capital to the highly litigious process of weak patent challenges. As the law is currently written, Nephron would not receive the financial benefit of the 180 day exclusivity window, even if Nephron prevails in the weak patent challenge case. This is a disincentive for companies like Nephron to challenge weak patents and restricts price competition in the drug market. It is crucial to understand that the generic drug pricing model will not deliver significant cost savings to the consumer, until the 3rd and 4th competitor has entered the market. The FDA research presented below notes the average price drop of a dose of product from the 1st generic manufacturer to the 4th generic manufacturer is 61%.

Generic Competition and Drug Prices

Source: FDA analysis of retail sales data from IMS Health, IMS National Sales Perspective (TM), 1999-2004, extracted February 2005

The Position of Nephron Pharmaceuticals Corporation on H.R. 1706

On March 31, 2009, testimony to the Subcommittee on Commerce Trade and Consumer Protection Energy and Commerce Committee, US House Of Representatives was given regarding H.R. 1706 by some of the largest generic drug manufacturers in the world. Those large companies explained their positions eloquently, and testified drug prices fall as much as 20% when they enter the market. I am here to offer the perspective of a

¹ FDA. (2005, February 1). *Generic Competition and Drug Prices*. Retrieved May 1, 2009, from www.fda.gov/cder/ogd/generic_competition.htm
Page 5

manufacturer that may file third or fourth. With our entrance into the market..... **prices fall 60% and more!** In fact, our very existence has been charted by the ability to compete behind the first and second filers. For this reason, my recommendations to the committee, as a family owned manufacturer, differ from a large scale publicly owned one. Drug companies are engaging in a business practice using “patent settlement agreements”, and Hatch-Waxman Act paragraph IV certifications, to create disincentives to generic drug manufacturers from challenging weak patents in the courts. Nephron is in opposition to collusive business practices known as “patent settlement agreements” between generic and branded drug companies and **strongly** supports H.R. 1706.

For the generic and branded pharmaceutical companies that have aligned themselves through patent settlement agreements, there is tremendous incentive to maintain the status quo due to the enormous profits generated for each day a product remains protected by a weak patent. My competitors, large generic manufacturers, often refer to their settlement agreements as “pro-consumer”. This is only slightly true, because with a third or fourth competitor in the market, the generic drug pricing model takes over, allowing for pricing to reach truly “pro-consumer” levels. Weak drug patents should receive adequate review in a court venue. In court, it is the burden of potential competitors to fund the analysis and arguments, while generating new and novel approaches to the drugs they can produce. By supporting H.R. 1706, the committee will restore the original vision of Hatch-Waxman, which is to allow generic drug companies to rationally invest in challenging weak patents. Increasing the availability of generic drugs is vital to lowering costs within the U.S. healthcare system.

Nephron’s Recommendation for H.R. 1706

1. Nephron recommends that the committee adopt H.R. 1706 and eliminate the practice of patent settlement agreements.
2. Nephron urges the committee to consider a major change in Hatch-Waxman, by changing the “first to file” approach to a “first to win the patent case without

settlement” approach. If Nephron were to win in court challenging a weak patent, Nephron would expect to be the sole beneficiary of the exclusivity period starting when the weak patent is knocked out, regardless of its position among other “paragraph IV” filers.

3. The “first to win” approach is likely to be time consuming, expensive and an all-or-nothing proposition. Therefore, Nephron proposes to the Committee to consider expanding the exclusivity period from 180 days to one year. A company investing in a successful challenge to a weak patent deserves to achieve a reasonable rate of return on its investment, and the expanded exclusivity period would provide more incentive and protection to the challenger. After the expiration of the one year exclusivity period, the market for the new generic drug would be open to all respective abbreviated new drug application (“ANDA”) holders. Nephron believes that four to five competitors would readily enter and compete in the market place for the new generic drug one day after the expiration of the exclusivity period.

We feel the implementation of our recommendations would create an extremely competitive marketplace, and it is only with greater competition that lower prices will reach the American consumer.

Thank You, Mr. Chairman, my family and I are extremely grateful for the opportunity to speak to the committee in support of H.R. 1706, which we feel is critical in lowering costs to the American consumer. I am happy to answer any questions you may have.

Page 7

Mr. JOHNSON. Thank you, sir.
Mr. Donatiello?

TESTIMONY OF GUY DONATIELLO, VICE PRESIDENT, INTELLECTUAL PROPERTY, ENDO PHARMACEUTICALS, CHADDS FORD, PA

Mr. DONATIELLO. Thank you, Mr. Chairman and Members of the Subcommittee, for the opportunity to be here today. I am Guy

Donatiello, vice president for intellectual property for Endo Pharmaceuticals.

Endo is a midsized pharmaceutical company based in Chadds Ford, Pennsylvania, and employs nearly 1,500 people throughout the U.S. I am a patent attorney working in this field for more than 20 years. As a midsized pharmaceutical company that brings to market both branded and generic products, patents are critical to Endo's success.

On the branded side, strong patents permit Endo to innovate and bring new medicines to market to treat unmet medical needs. On the generic side, patent expirations that were designed around branded medicines permit us to bring to market low-cost generics that benefit patients.

Our ability to defend and to challenge patents underpins our continued success and fosters future medical innovation for tomorrow's cures. Legislation banning certain patent settlements is unnecessary and harmful. It would halt pro-consumer settlements, erode the value of patents, chill incentives for medical innovation, and reduce patient access to generic drugs.

There are current mechanisms in place to handle truly anti-competitive settlements. To be clear, current law dictates that every settlement between a brand and a generic must be submitted to the FTC for review, and any settlement that is judged to be anti-competitive can be invalidated.

This judgment is a result of fact-sensitive litigation that recognizes that every case is different and every case might result in a unique compromise. Under the proposed legislation, generic companies may bring fewer patent challenges if they have fewer options to resolve litigation without the cost and risk of going to trial.

The rapid increase in generic utilization has been fueled in part by the fact that branded and generic manufacturers have been able to settle some patent suits in appropriate ways. Banning certain types of patent settlements would restrict the ability of both branded and generic companies to settle ANDA patent cases logically.

As a result, it would force companies to engage in patent disputes that might otherwise be settled reasonably, quickly, and in the public interest. The parties involved could be forced to spend significant resources on litigation, diverting those resources from valuable re-investment in future innovation.

In addition, statistics show that innovators are likely to win the majority of patent cases litigated through appeal, and these patents would otherwise bar generic entry until they expire.

In contrast, a settlement might include a provision allowing the generic to come to market well before the patent expires and getting a low-cost generic into patients' hands sooner.

There are circumstances where the impact of banning certain patent settlements could result in companies being forced out of business. Small companies are particularly vulnerable because they often rely on just one or two branded products for revenue. These products are often too small or specialized to be profitable for larger companies. It is the smaller companies that bring these medicines to patients who need them.

When generic competition threatens these patented products through an ANDA filing, a patent dispute often results. Because

the small branded company is so dependent on the product being disputed, losing the patent case threatens the company's very existence.

Furthermore, if a generic company launches its product during litigation, it may ruin the branded company. Even if the branded company subsequently wins the case and generic is withdrawn, the harm has already been done; the genie cannot be put back in the bottle.

On the generic side, the development of generics is not always smooth. A generic company may work on a project for years and never duplicate the brand to the FDA's satisfaction. By the time an ANDA is filed, significant resources have been invested.

Allowing settlements where a generic can recoup some of this investment and then reinvest it allows them to develop more low-cost generics for patients. Conversely, adding new barriers to settlements will increase uncertainty, sap resources, and chill investment in these new generic medicines.

In short, when a small company becomes involved in complex, lengthy, and expensive litigation with an uncertain outcome, the continued existence of that company is threatened. Resources for future R&D are inevitably squeezed and channeled into legal fees. Patients are the real losers because access to future branded and generic medicines will be delayed or denied.

In conclusion, H.R. 1706 would add additional cost and uncertainty to bringing new branded and generic medicines to patients. Instead of an across-the-board ban, enforcement agencies and courts should continue to evaluate patent settlements on a case-by-case basis.

While it is a delicate balance, the current system works; innovation is rewarded and competition is robust. H.R. 1706 would restrict settlements, and competition between branded and generic manufacturers would suffer, and patients would suffer. There would be fewer medicines to treat diseases and also less price competition.

I would be happy to answer any questions you might have.

PREPARED STATEMENT OF GUY DONATIELLO

Statement

Of

Guy Donatiello

Endo Pharmaceuticals Inc.

Before the

House Judiciary Committee

Subcommittee on Courts and Competition Policy

Hearing On

**Pay to Delay: Are Patent Settlements that Delay Generic Drug Market
Entry Anticompetitive?**

2141 House Rayburn Building

June 3, 2009, 9:30am

Mr. Chairman and Members of the Subcommittee, my name is Guy Donatiello and I am the Vice President for Intellectual Property for Endo Pharmaceuticals Inc. I am a patent attorney and have worked exclusively in the intellectual property field for more than twenty years.

Endo is a specialty pharmaceutical company engaged in the research, development, sale, and marketing of branded and generic prescription medicines in pain management, urology, endocrinology, and oncology. Endo is based in Chadds Ford, Pennsylvania and employs nearly 1,500 people throughout the United States.

Endo is a mid-sized company with \$1.2 billion in sales in 2008. We are a member of PhRMA, our trade group that represents the country's leading research-based pharmaceutical and biotechnology companies which as an industry invested over \$50 billion in research and development in 2008. In addition, Endo is a member of America's Specialty Medicines Companies, an informal working group of mid-sized pharmaceutical companies.

Thank you for the opportunity to testify on behalf of the biopharmaceutical industry regarding an issue of great importance to future medical innovation and patient care: patent settlements and competition in the marketplace. I hope I can provide you with a unique perspective on this issue as a representative of a mid-sized pharmaceutical company that participates in both the branded and generic markets.

Before I respond directly to the issue we are here to discuss, I would like to point out that pharmaceutical products effectively have a shorter period of useful patent life than other types of products. Pharmaceutical companies

must obtain FDA approval before marketing their products, and by the time the medicine comes to the market, there is usually far less time before patent expiration than with other products. Hatch-Waxman attempted to balance the interests of both branded and generic companies by recognizing these patent life challenges. The law made it easier for generics to come to market but also restored to branded companies some of the patent time lost during clinical research and the FDA regulatory review process.

As a mid-sized pharmaceutical company that brings to market both branded and generic medicines, patents are critical to our success in both commercial areas. On the branded side, strong patents permit Endo to innovate and bring new medicines to market to treat unmet medical needs and to compete, **on price**, with other branded products in the same therapeutic class to the benefit of patients. On the generic side, patent expirations of branded medicines permit us to bring to market medicines that will compete with generic and branded counterparts, **also on price**, to the benefit of patients.

Our ability to defend, and to challenge, patents underpins our continued success and fosters future medical innovation for tomorrow's cures. Legislation banning certain patent settlements is unnecessary and harmful. It would halt pro-consumer settlements, erode the value of patents, chill incentives for medical innovation, and reduce patient access to generic drugs.

There are current mechanisms in place to handle truly anti-competitive settlements. To be clear, current law dictates that every settlement between a brand and generic must be submitted to the FTC for review, and any settlement that is judged to be anti-competitive can be invalidated.

This judgment is a result of fact-sensitive litigation that recognizes that every case is different and every case might result in a unique compromise in settlement. Under the proposed legislation, generic companies may bring fewer patent challenges if they have fewer options to resolve litigation without the cost and risk of going to trial. The rapid increase in generic utilization has been fueled in part by the fact that branded and generic manufacturers have been able to settle some patent suits in appropriate ways without taking every case through trial and appeal.

Banning certain types of patent settlements would restrict the ability of both branded and generic companies to settle ANDA patent cases logically. As a result, it would force companies to engage in patent disputes that might otherwise be settled reasonably, quickly, and in the public interest. The parties involved could be forced to spend significant resources on litigation, diverting those resources from valuable investment in future innovation. In addition, statistics show that innovators are likely to win the majority of patent cases litigated through appeal, and these patents would bar generic entry until they expire. In contrast, a settlement might include a provision allowing the generic to come to market well before the patent expires, getting a low-cost generic into patients' hands sooner.

Under certain circumstances, the impact of banning certain patent settlements could result in companies being forced out of business. Small to mid-sized companies like Endo are particularly vulnerable because they often rely on just one or two branded products to generate revenue. These revenue-generating products are often medicines with revenues too small or markets too specialized to be profitable for larger companies to bring to market. It is the smaller companies that bring these medicines to the patients

who need them. When generic competition threatens these patented products through an ANDA filing, a patent dispute often results. Because the small branded company is so dependent on the product being disputed, losing the patent case threatens the company's very existence. Furthermore, if a generic company launches its generic product during a long and expensive litigation, it may ruin a small branded company; even though the branded company may ultimately win the litigation and compel the generic product off the market, the harm has already been done – the genie cannot be put back in the bottle.

I would like to turn to the generic drug development process to highlight another point. The development of generic drugs is not always a smooth pathway with success as a given. Despite excellent scientists, a generic company may work on a project for years and never duplicate the brand to FDA's satisfaction. By the time an ANDA is filed, significant resources are committed to the project based on an anticipated return on investment. Allowing settlements where we recoup some of our investment allows us to develop more low-cost generics for patients. Conversely, adding new barriers to settlements will increase uncertainty, sap resources, and chill investment in new generic medicines.

In short, when a small company, whether a branded manufacturer or a generic challenger, becomes involved in complex, lengthy, expensive litigation with an uncertain outcome, the continued existence of that company is threatened. Resources for future R&D are inevitably squeezed and channeled into legal fees. Patients are the real losers because access to future branded and generic medicines will be delayed or denied.

In conclusion, H.R. 1706 would add cost and uncertainty to bringing new branded and generic medicines to patients. Instead of an across-the-board ban, enforcement agencies and courts should continue to evaluate patent settlements on a case-by-case basis, examining all relevant facts including the strength of the patent and whether the settlements benefit consumers.

While it is a delicate balance, the current system works – innovation is rewarded and competition is robust. Without the ability to make full legitimate use of intellectual property rights, the innovative process that results in intense competition between and among branded and generic manufacturers will suffer, and patients will ultimately suffer. There will be fewer medicines to treat diseases. And with fewer medicines there is also less price competition.

Thank you. I would be happy to answer any questions.

Mr. JOHNSON. Thank you, sir.
Mr. Vaughan, proceed.

**TESTIMONY OF WILLIAM VAUGHAN, SENIOR HEALTH POLICY
ANALYST, CONSUMER UNION, WASHINGTON, DC**

Mr. VAUGHAN. Mr. Chairman, Mr. Coble, thank you very much for inviting us to testify.

Consumers Union is the independent nonprofit publisher of Consumer Reports, and we don't just test tires and toasters. We try to help people with really good medical products. And we have an aggressive use of comparative effectiveness research to provide a free service to people in determining the most effective, safest, best buy drugs, and both brand and generic.

And when a generic is available, we always find it is a better price. Sometimes it is better quality or safer and sometimes more effective. So we frequently recommend generics—not always, but we like to see a steady flow of new generics into the market without extra legislative or legalistic hassles, if you will.

And it is particularly important right now. We polled about 2,000 households this spring. And because of cost, 28 percent of your constituents are saying they are not filling their prescription, they are skipping a day's dose, or they are cutting a pill in half. And that is not good. And generics could help make drugs affordable for people.

It is also important for the government. Gosh, we just, in Medicare Part D, picked up a new, \$9.4 trillion 75-year liability. It would be neat to have as much savings in that as possible, especially since the Medicare folks are predicting that drug inflation is about to accelerate again.

So to answer the Subcommittee's question, yes, we think these reverse settlements are anticompetitive. Now, I am not a lawyer, and I am kind of nervous sitting in a room full of lawyers on this pretty technical issue, but I think there is some common sense in here.

I had a chance to see that wonderful Lincoln exhibit on his bicentennial at the Library of Congress. And he always used such commonsense words. He used this phrase: If slavery is not wrong, nothing is wrong. And I think American consumers sitting around their kitchen tables would say, "If payments like this are not a violation of the spirit and meaning and intent of the Nation's anti-trust laws, then nothing is, nothing is wrong."

We strongly support the FTC and, in my testimony on page five, use some charts from one of their previous testimonies as to how this system works. And I think it is very simple when you lay it out in charts.

On page six of my testimony, continuing a couple of those charts. If I understand the argument of the industry, they are saying that it is only if you let the for-profit brand companies give some money to a for-profit generic—diagram one—only then will you speed up the day that the two parties will get together and lower their prices and reduce their profits so consumers can benefit voluntarily. I wish Jon Stewart or Colbert or the Onion were here, because that is a hard one to do with a straight face, in my opinion.

And that is why we strongly endorse H.R. 1706. We hope you will include it in health care reform this year, because it should score for big savings. It has a little exception for that, blue moon case where the consumer could actually be helped, then the FTC could make an exception. It deals with the 180-day issue, where a generic can block everybody else, but not actually market new pills.

We hope you will deal with some of these other gimmicks. We agree with Mylan on the problem of authorized generics. That is really a buzzword for not having true generic competition.

And there are plenty of other issues in the drug world that need addressing. One of the big ones, one of the real big monopolies out there is the unlimited monopoly in life-saving, very expensive biologics. And we hope as part of reform you will support a bill like Mr. Waxman's which will give us some sort of pathway to eventually getting biogenerics to market. That is an important cost saver.

Mr. Chairman, we thank you and wish you good luck in this incredibly important consumer issue. Thank you very much.

[The prepared statement of Mr. Vaughan follows:]

PREPARED STATEMENT OF WILLIAM VAUGHAN

Testimony of
William Vaughan,
Senior Health Policy Analyst
Consumers Union
Non-Profit Publisher of *Consumer Reports*
June 3, 2009

Subcommittee on Courts and Competition Policy
Committee on Judiciary
U.S. House of Representatives

**Pay to Delay: Are Patent Settlements That Delay Generic Drug Market Entry
Anticompetitive?**

Mr. Chairman, Members of the Committee:

Thank you for the invitation to testify today. Consumers Union is the independent non-profit publisher of *Consumer Reports*.¹ Consumers Union investigates and reports extensively on the issues surrounding the costs, safety, and effectiveness of prescription drugs and other health products so that we can provide physicians and consumers with expert, non-biased information.

Attachment #1 describes our Best Buy Drugs program. This is a major campaign by Consumers Union to use comparative effectiveness research to provide free, unbiased information to doctors and patients on the safest, most effective brand and generic drugs, and then to make a best buy recommendation. These recommendations can save consumers thousands of dollars a year.

To answer the hearing question: Absolutely!

Consumers Union absolutely believes that payments between brand and generic drug companies that delay the entry of generic drugs are bad for consumers and are the very definition of anti-competitive behavior. We support legislation to ban these payments—bills such as HR 1706 by Representatives Rush, Waxman, and others, and S.369 by Senators Kohl, Grassley, and others. That bill clarifies the law to make these agreements illegal and is a necessary step to give the enforcers and the courts the ability to stop this egregious conduct which costs consumers over \$12 billion annually in excessive drug prices.

Almost all of these settlements restrict generic competition at the expense of consumers, whose access to lower-priced generic drugs may be deferred for years. These settlements also

¹ Consumers Union, the nonprofit publisher of *Consumer Reports*, is an expert, independent organization whose mission is to work for a fair, just, and safe marketplace for all consumers and to empower consumers to protect themselves. To achieve this mission, we test, inform, and protect. To maintain our independence and impartiality, Consumers Union accepts no outside advertising, no free test samples, and has no agenda other than the interests of consumers. Consumers Union supports itself through the sale of our information products and services, individual contributions, and a few noncommercial grants.

jeopardize the health of millions of Americans who have difficulty obtaining safe and effective medicines at affordable prices. In light of the recent increased use of these agreements, we hope that you will quickly pass legislation like HR 1706. There is an excellent chance that CBO will score it with savings, perhaps substantial savings, and we hope you will consider adding it to any Health Reform legislation Congress considers this year, as a partial pay-for.

This testimony

--discusses why generic drugs are critical to affordable health care today and how Consumers Union is educating its readers and the public about the substantial benefits of using the most effective drugs, whether brand or generic;

--explains how the dynamics of generic drug competition create powerful incentives for brand-name and generic companies to settle patent litigation in a way that harms consumers;

--urges that other anti-competitive practices, such as abuse of the generic 6-month exclusivity provision and 'authorized generics' be addressed.

The testimony also describes Consumers Union's support of several other legislative changes to help consumers, speed generic entry and improve pharmaceutical research and consumer information, including: (a) creating an incentive for other "later filer" generic firms to successfully challenge patents by permitting them to secure exclusivity, (b) eliminating the abuse of 'authorized generics', (c) clarifying the law to provide for the development of generic versions of complex molecular biologic medicines (biosimilars), (d) clearing the backlog of generic applications at the FDA, (e) eliminating the abuse of citizen petitions in the generic drug approval process, (f) using Medicare to control costs while encouraging innovation, and (g) advancing the pace of drug R&D and consumer safety.

Rapid Entry of Generic Drugs Can Help Dampen High Health Care Costs Now, Assisting Families and Governments in a Difficult Time

Health care costs continue to surge at double or more the rate of general inflation. While drug inflation has moderated in recent years—in large part due to the increased use of generics—it is still a serious burden to consumers and government and private insurers, and the higher rate of inflation is expected to resume in a few years.²

High costs impact families: We all know how badly the high cost of health care is hurting America's families, especially now in this time of recession and high unemployment. Because

²From AARP's "Rx Watchdog Report," April, 2009: "In 2007, US health care spending growth slowed to its lowest rate since 1998. A majority of this change was due to retail prescription drug spending, which grew 4.9 percent in 2007, the slowest rate of growth since 1963. The deceleration in prescription drug spending, in turn, was largely attributed to generic drugs, including a further increase in the generic dispensing rate and slower growth in prescription drug prices due to the introduction of generic equivalents for several blockbuster drugs."

generics are substantially cheaper than brand name drugs, it is more important than ever that we ensure that generics come to market without collusive, anti-competitive delays.

In a poll of over 2000 households this spring, Consumers Union found 28 percent of the public has tried to reduce health care costs by not filling prescriptions, skipping doses or cutting dosage in half without their doctor's approval—all potentially dangerous actions and bad for the long-term health of those who need drugs like statins, diabetes medicines, etc.³ In particular, seniors and people with disabilities on Medicare will need extra help in the next several years dealing with high drug prices, because Social Security COLAs are estimated to remain at zero or close to zero, yet Part D premiums are likely to increase, cutting into the net Social Security check.

Costs of drugs impact governments and taxpayers: In 2008, the federal government was projected to have accounted for 31 percent of the \$235 billion spent on prescription drugs, and the Federal government's share is expected to rise to 40 percent by 2018.⁴ The new Part D program added a tremendous future obligation onto the government: \$9.4 trillion in present value costs to Medicare over the next 75 years, with Part D outlays estimated to increase from 0.4 percent of GDP to 1.8 percent by 2083. In the short-run, the Part D average annual increase in expenditures is estimated to be 11.1 percent through 2018, while the US economy is projected to grow by only 4.5 percent.⁵

Generics dramatically lower costs: The rapid entry of generic drugs into the market can help dampen health inflation by providing equally safe and effective medicine at a far lower price—often prices up to 80 percent or less of the brand name drug and capturing 44 to 80 percent of sales in the first year of generic launch⁶. In 2007, the average retail price of a generic prescription drug was \$34.34, while the average retail price of a brand-name prescription was \$119.51 and almost 70 percent of all prescriptions are now for generics.⁷ It has been estimated that generic drugs save consumers between \$8 and \$10 billion each year.

Generics also inflate substantially less than brand name drugs:

“Prices for generic drugs increase more slowly than prices for brand-name drugs. In 2008, the average price inflation for generic drugs used by Medco members was only

³ CU March 17, 2009 Poll. In addition, CMS “posits that the slowdown for prescription spending is likely due to the effects of the recession, which may be causing consumers to shift from more expensive brand-name drugs to lower-cost generics and to fill fewer prescriptions.” Quote from 2009 Drug Trend Report, Medco, p. 6. The importance of affordable maintenance medicines can be seen in the fact that a person starting on a generic maintenance drug has a 62 percent better chance of staying on it, than a person started on a non-preferred brand drug, according to ARRP testimony before the Energy and Commerce Committee, 3/31/09.

⁴ CMS National Health Expenditures, 2008.

⁵ Medicare Trustees Report, pp. 2, 3, and 127.

⁶ Testimony of FTC Commissioner Jon Leibowitz, before Senate Judiciary Committee, January 17, 2007.

⁷ GPhA Website, Facts at a Glance.

0.5%, and unit costs for many generic drugs actually declined as market competition expanded. In contrast, the average price inflation for brand-name drugs was 8.4%.⁸

“In 2008, the average annual increase in manufacturer prices charged to wholesalers and other direct purchasers for brand name prescription drugs widely used by Medicare Part D beneficiaries was 8.7 percent, or about 2.3 [times] the general inflation rate of 3.8 percent. The 2008 average rate of increase in manufacturer prices of specialty drugs (brand and generic) was even greater—9.3 percent. By contrast manufacturer prices of (non-specialty) generic drugs widely used by Medicare beneficiaries *decreased* by an average of 10.6% in 2008.”⁹

Many generics about to enter market: What is exciting for consumers is that there are major brand-name medicines about to be available in generic form—if anti-competitive and collusive practices do not block their timely entry. As of the fall of 2007, Hatch-Waxman challenges were pending for over 120 brand name prescription drugs with combined annual sales of over \$90 billion, and it is estimated that between now and 2012, about \$139 billion in international annual sales of brand-name drugs will face generic competition.¹⁰

Clearly, it will be a major help to America’s consumes and taxpayers if the expected flow of generics to market is not thwarted by anti-competitive, collusive payments between brand and generic drug manufacturers.

The Dynamics of Generic Drug Competition Create Powerful Incentives for Brand-Name and Generic Companies to Settle Patent Litigation in A Way that Thwarts the Objectives of the Hatch-Waxman Act.

The economics surrounding generic entry create powerful incentives for brand-name and generic companies to enter into these types of patent settlements. These incentives are created because the total profits available to the brand-name company prior to generic entry exceed the total profits of both the brand-name and generic applicant after generic entry. As a result, the brand-name company has a powerful economic incentive to pay the generic applicant something more than it would earn by entry with its generic product, because the sum the brand-name company pays will still be less than it would lose if the generic applicant did enter the market. Likewise, the generic applicant who is sued for patent infringement can earn more by entering into a settlement in which it agrees to defer market entry—do nothing—than it could earn by winning its patent challenge and competing in the market. In short, when these payments are allowed, the generic company may obtain more by settlement than it could have obtained by outright victory in the patent case.

⁸ Medco, Drug Trend Report, 2009, p. 22.

⁹ AARP Rx Watchdog Report, April, 2009.

¹⁰ *Ibid.*

The following pie charts from FTC Commissioner Rosch before a House Energy and Commerce Subcommittee this March 31st clearly makes the point:

Let me see if I understand the argument of the brand and generic industries? They say we should allow their for-profit brand members (whose fiduciary duty is to their stockholders to make profits) to pay the for-profit generic companies (whose fiduciary duty is to their stockholders to make profits)—diagram #1. They then say that we should permit this because it will encourage both industries to more quickly bring generics to market—diagram #2—where both for-profit parties will make less money and less profit. The industries say that prohibiting these payments will delay the day that they both voluntarily act together to help the consumer with lower drug prices while reducing their own profits.

That is their argument. Said with a straight face.

As Columbia University Law Professor C. Scott Hemphill testified before the Energy and Commerce Committee March 31st, “If the brand-name firm paid a rival after patent expiration to abandon its effort to market a competing drug, that transaction would clearly be inappropriate. The same is true when the privately arranged extension postpones an entry date that is prior to patent expiration.”

The argument is made that some of these reverse payment settlements have led to bringing more quickly a generic to market. Like a Blue Moon, it is possible. And HR 1706/S. 369 allow the FTC to recognize and accept such settlements in the rare cases they occur.

But in the great majority of cases, it would be extremely naïve to assume that the Diagram #1 above is being done to help speed up the results in Diagram #2. The FTC has provided massive documentation that in most cases, these payments cost the consumer—and the cumulative cost is running in the billions.

As this Committee knows, the courts have not grasped the reality of the anticompetitive effects of these settlements. Absent Congressional action the substantial harm to consumers will

continue. If the law is not clarified pharmaceutical patentees will continue to pay off generic firms to terminate patent challenges that would otherwise generate *billions* of dollars in consumer savings. The costs are substantial: a recent study by Professor C. Scott Hemphill of Columbia Law School found that consumers are paying over \$12 billion more annually because of these exclusion payments.²

Attachment #2 is a discussion of how and why these problems arose and why legislative action is needed as soon as possible.

Other Legislative Suggestions to Help Speed Generic Entry.

Congress should also consider several other alternatives to support the effort to assure consumers receive access to safe and low cost generic drugs as quickly as possible.

First, the Hatch Waxman Act should be amended to give “later filers” – generic firms that are not the first to file a patent challenge, the opportunity to secure exclusivity if they successfully challenge a patent. Preventing exclusion payments is a necessary, but not sufficient step to preventing the gaming of the regulatory system to delay generic entry. A subsequent generic patent challenger often is well positioned to successfully challenge and invalidate a patent. Unfortunately, under the current system, there is little incentive for the subsequent filer to take on the burden of expensive patent litigation, since it cannot secure any exclusivity if it succeeds. Congress should address this issue by giving a subsequent filer who successfully challenges a patent a period of exclusivity.

Second, we hope that you can address the problem of ‘authorized generics.’ The very phrase should raise red flags about the level of competition from an ‘authorized’ generic. It is just another way to avoid rigorous, meaningful competition. An authorized generic is a generic which enters under a licensing arrangement from the branded firm. These authorized generics occur at the end of patent life and seem intended to undermine the reward system established under the Hatch-Waxman Act which gives the first generic filer a six-month period of exclusivity. Without the rewards of exclusivity the incentive to challenge pharmaceutical patents is diminished. Moreover, branded firms often use the threat of an authorized generic to force generic firms to enter into these anticompetitive settlements.

Third, we urge Congress to stop the use of phony citizens petitions to delay generic entry. According to the FDA, only 3 of 42 petitions answered between 2001 and 2005 raised issues that merited changes in the agency's policies about a drug. For example, Flonase, a commonly used prescription allergy medication, went off-patent in May 2004. But GlaxoSmithKline stretched its monopoly window by almost two years with citizen petitions and a legal challenge to the use of generics. We recommend Congress end this abuse.

Fourth, there is no clear pathway, in law or FDA regulation, providing for FDA approval of generic versions of complex molecular biologic medicines which are so important in modern medicine (although the Europeans are moving ahead in this area). To date, the developers of biologics have a de facto monopoly market stretching as far as the eye can see. One such drug on

the market for the past twenty years has probably earned its company \$20 billion from Medicare alone, and there is still no generic in the U.S. These new biologic products are the most expensive medicines on the market—some costing as much as \$100,000 to \$250,000 for a course of treatment. Consumers Union and the Congressional Budget Office believe that biogenerics could provide billions in savings and can be provided safely, thus helping some of our most severely ill patients. The CBO estimate on Chairman Kennedy's S. 1695 from the 110th Congress (with a 12 year exclusivity compared to Chairman Waxman's proposal of 5 year exclusivity) showed total savings to the economy of \$25 billion between 2009-2018 or about 0.5 percent of national spending on prescription drugs at wholesale prices.¹¹ (Presumably, a 5-year exclusivity bill will show even larger savings.) Existing FDA law should be clarified to allow the U.S. to do what the Europeans are doing: bringing some relief to consumers. Therefore, we hope that as part of health reform, Congress will enact legislation like Chairman Waxman's bill, HR 1427.

Fifth, we urge Congress to provide the FDA with sufficient resources to eliminate the backlogs in the approval of generics. The President's new FY 2010 budget request asks for \$36 million to "provide greater access to affordable generic drugs and improve the productivity of generic drug review through a new user fee program." As the FDA testified last month:

In the coming years, patents will expire on more than a dozen blockbuster brand-name drugs that account for tens of billions of dollars in prescription spending annually. Generic competition for these drugs will likely be very strong. It is imperative that FDA have the resources to ensure the safety, quality, and therapeutic equivalence of generic drugs and allow Americans to benefit from the savings from lower cost generic drugs¹²

We urge Congress to approve this request—consumers must have confidence in generics, and the faster we can move these safe drugs to market, the faster we can help families meet their medical costs.

Finding other ways to help consumers hold down drug costs while promoting drug innovation

Whenever consumers question a pharmaceutical industry policy, no matter how anti-consumer, the industry says that if there is any reduction whatsoever in their profit margins, they won't be able to invent the cures to the diseases we all dread. Even though about 85 percent of new drug approvals are just for me-too drugs and bring little new to the medical world, this threat is always troubling. We believe that there many policies that Congress should consider to encourage the industry to spend more on true R&D while helping consumers obtain access to more generics, faster. We hope that you will join us in considering some of the following types of policies:

¹¹ Letter of CBO of June 25, 2008 on S. 1695

¹² Statement of Joshua Sharfstein, MD., Principal Deputy Commissioner, FDA, before Senate Appropriations Committee, Subcommittee on Agriculture, Rural Development, FDA, and Related Agencies, May 21, 2009.

- require drug rebates to Medicare for drug inflation in excess of population and CPI growth, except no rebates would be required on new breakthrough drugs (as defined in the FDA approval process), thus controlling costs while encouraging drug innovation;
- amend the FDA laws to require that new drugs be tested against the best practice in the field, not just against a placebo;
- increase the world's medical scientific base by eventually making Phase I trial results, both the successful and the unsuccessful, public;
- after ensuring safety, permit the importation of drugs (Berry et al, HR 1298), including biosimilars;
- prohibit drug, device, and other vendor gifts to providers (Physician Payments Sunshine Act by Kohl, Grassly, Stark, DeFazio);
- provide additional rebates from the 20 percent of Part D plans that have the lowest generic drug substitutions rates in cases where a generic is exchangeable with a brand;
- permit Medicare to negotiate on drug prices (Berry et al., HR 684)¹³; special attention should be given to negotiating prices on selected biologics;
- enact a two or three year moratorium on the direct-to-consumer advertising of newly approved prescription drugs, for safety reasons (proposals by DeLauro and others); require rebates for the increased high-cost drug utilization caused by such advertising.

Our Hope that the Judiciary Committee will Examine the Growing Concentration in the Health Insurance Industry, and Why Insurers have been Unable to Control Costs Better. Is it an Argument for a Public Plan Option in Health Care Reform?

Finally, switching topics, in this year of health care reform debate, we urge the Subcommittee and Committee to consider an investigation into why the health insurance industry has failed so badly to control health care costs, and whether our experience with this increasingly-concentrated industry doesn't argue for a public plan option as part of health care reform.

For decades, the health delivery marketplace has been inflating roughly twice as fast as the rest of the economy, creating special burdens for American businesses and taxpayers, and raising rates of un-insurance, under-insurance, personal bankruptcy and increased morbidity and even mortality for uninsured consumers.

Recently, there have been rumors of possible further mergers among some of the nation's largest health insurers.

¹³ This provision receives an amazing 86 percent support in the Kaiser Family Foundation Health Tracking Poll of April, 2009.

We believe it would be useful for Congress to investigate the level of market concentration in the health insurance versus health provider sectors to determine if there are steps that should be taken in health reform to bring us a system which is better at reducing the cost of health insurance for employers, employees and their families.

A Congressional investigation could address the following kinds of questions:

It is often thought that a large buyer can demand discounts and be able to control costs better than many small purchasers. At the same time, it is usually feared that a monopolist will collect excessive profits from their market dominance. There are reports that in a sixth of our large metropolitan areas, a single insurer/purchaser has enrolled 70 percent or more of the local consumer-patient population. It would seem that in such a situation, the insurer could both control costs and reap windfall or oligopolistic profits. Obviously the insurers are not doing a good job controlling costs, but are they collecting higher than expected profits? That is, do we have the worst of both worlds: higher profits being added to failure to control costs?

But at the same time that insurers have been consolidating, there are reports that in many markets, hospital and physician practices have been merging and have formed a dominant countervailing force. Has the consolidation of providers been a contributing factor in the crippling rate of health inflation? Yet while oligopolistic or even monopolistic behavior among providers is a source of concern, so is quality of care. And there is strong data that smaller hospitals, which do limited numbers of procedures, often have a difficult time delivering quality outcomes. In general, consumers needing complex treatments are well-advised to seek out hospitals and practices which do large volumes of such treatments (centers of excellence) and which coordinate care. From a quality, medical education, and research point of view, a larger health care provider can often be a good thing.

The March 2009 Medicare Payment Advisory Commission report to Congress provides a remarkable chart showing that an eighth of the nation's larger hospitals which deliver the highest quality care have, on average, positive Medicare margins and are below average cost hospitals. The other seven-eighths of the hospitals have poorer quality and higher costs. It is MedPAC's thesis that while Medicare is paying approximately 100% of the costs of an efficient provider, the private insurers (who have become relatively consolidated and may be planning further consolidation) are paying about 132 percent of cost at most hospitals. Basically, MedPAC is saying that the private insurers, despite their growing consolidation, have become toothless buyers, and are often turning a blind eye to the unacceptable rate of medical inflation.

This raises a fundamental question: if large private buyers, who for marketing reasons feel a need to maintain a broad network of health care providers, cannot control costs, what is the alternative? As we consider health care reform, doesn't this argue for a public plan option (like Medicare) that can set rates at the approximate level of cost that an efficient provider can deliver quality care?

If the current situation does not argue for a public plan option, then why are these large insurers not doing a better job in controlling health care inflation, and what hope is there that they will do

a better job in the future? What kinds of amendments would Congress need to make to ensure that the private payers can hold inflation down to at least Medicare's past rates of growth?

Attachment #1**Best Buy Drug Campaign**

Consumer Reports strongly encourages consumers to talk to their doctor about the use of generics as a way to save money while obtaining quality health care. We have made a major organizational commitment to educate consumers about generic drugs and to help consumers obtain reliable, easy-to-understand advice about the safest, most effective brand or generic, and lowest cost prescription drugs available. In December 2004, Consumers Union launched *Consumer Reports Best Buy Drugs*, a free public education project. Attached is a sample *Best Buy Drugs* summary report on prescription drugs to relieve heartburn. We currently provide information for 40 different medical conditions, and we plan to expand to additional classes in the near future.

The goals of *Best Buy Drugs* are to:

- improve the quality of care by ensuring people get the safest, most effective drugs—brand or generic—with the least side effects;
- improve access by helping consumers choose drugs that are most affordable (taking into account effectiveness, side effects, safety, and price); and
- help consumers and taxpayers by reducing the cost of health insurance, consumers' out-of-pocket expenses, and Medicare and Medicaid costs.

We estimate that a consumer who switches from a highly advertised, high-priced brand name drug to a *Best Buy Drug* can often save between \$1,000 and \$2,000 a year—or even as much as \$3,000 a year. If all Americans took advantage of the best buy generics, the economy would save billions of dollars. Approximately 100,000 *Consumer Reports Best Buy Drugs* reports are downloaded each month, including about 20,000 in Spanish. In addition to our Web site, www.CRBESTBUYDRUGS.org, we distribute print versions of our reports in five states with the help of pharmacists, senior organizations, doctors, and libraries. The *Best Buy Drugs* website also provides additional information describing how *Best Buy Drugs* operates and the rigorous evidence-based review that is used to derive the "Best Buy Drug" in each class of medicine.

Consumer Reports also has been active in reporting on the consumer benefits of generic drugs. Most recent, *Consumer Reports* published a report in its November 2006 issue that explained how cash prices for generic drugs vary widely at different types of pharmacies. The report concluded that for five highly prescribed generic drugs (fluoxetine, lisinopril, lovastatin, metformin, and warfarin), median prices at mass merchant and online pharmacies were approximately 20 to 50 percent less expensive than prices at supermarket and drug chain pharmacies. We urged our readers to shop around for the best deals.

Attachment #2**The Hatch-Waxman Act Exacerbates the Incentive to Settle Patent Litigation with Compensation Paid to the Generic Applicant.**

When Congress enacted the Hatch-Waxman Act, it represented a compromise between making available more low-cost generic drugs, while at the same time restoring patent life lost due to the length of FDA brand-name drug approval process. To accomplish this goal, Congress created a number of industry-specific incentives to speed generic entry. In order to see how these incentives work, and their effects on the dynamic of patent settlements, it is necessary to understand three unique features of the Act: a paragraph IV certification, the 30-month stay period, and the 180-day marketing exclusivity provision.

The Act establishes a procedure for accelerated FDA approval of generic drugs through the use of an "Abbreviated New Drug Application" (ANDA). The Act requires a generic applicant to show that its generic drug is "bioequivalent" to the brand-name drug. The generic drug manufacturer does not have to replicate the costly safety and efficacy tests for its drug; rather, the Act permits the generic company to rely on the safety and efficacy tests of the brand-name drug product.

One of the most important features of this application process is if the generic applicant seeks prompt approval of its generic drug, it must certify that its generic drug product does not infringe on the patents claimed by the brand-name drug product, or that patents claimed by the brand-name drug product are invalid. The Act names this a "paragraph IV" certification.

A generic applicant that makes a paragraph IV certification must notify the patent holder. If the patent holder does not bring an infringement action against the generic applicant within 45 days, the FDA may approve the ANDA, assuming the other regulatory requirements are met. Alternatively, if the brand-name company brings an infringement action during the 45-day period after notification, the patent owner is entitled to an automatic stay of FDA approval of the ANDA for 30 months (the 30-month stay). This process provides the brand-name company and the generic applicant an opportunity to litigate patent issues before the generic drug has entered the market and incurred any damage exposure.

The Act provides that the generic applicant to file the first ANDA containing a paragraph IV certification (the "first filer") for a particular brand-name drug is entitled to 180-days of marketing exclusivity. During this period, the Food and Drug Administration may not approve a subsequently filed ANDA for the same brand-name drug product. The 180-day period starts once the first filed generic applicant begins commercial marketing of its generic drug product. The real effect of this exclusivity period is that the FDA is prohibited from approving any subsequently filed ANDA for the same brand-drug product until the first filer's 180-day period of marketing exclusivity expires. The 180-day exclusivity period is an important incentive Congress provided to would-be generic entrants to encourage them to challenge weak or questionable patents claiming brand-name drug products or to design around a brand-name drug's patent.

It is important to note that the first generic competitor usually shadows prices the brand. Consumers usually do not really see sharp, dramatic drops in price until there are several generic competitors.

This regulatory structure exacerbates the economic incentives underlying patent settlements between brand-name companies and generic applicants discussed above. A settlement between the brand-name company and the first filer will avoid the brand-name company's lost profit potential. In addition, the 180-day marketing exclusivity provision blocks entry by subsequently filed generics until 180 days after the first filer actually begins commercial marketing. Unfortunately for consumers, the first filer has a powerful incentive to accept a settlement because it will not only get the brand name company's compensation, but it retains its 180-day marketing exclusivity when it does enter at a later date. Although both the brand-name company and the generic company are better off with the settlement, consumers lose the possibility of an earlier generic entry, either because the generic company would have prevailed in the lawsuit or the parties would have negotiated a settlement with an earlier entry date but no payment.

These Settlements Are Contrary to the Purpose of the Hatch-Waxman Act.

The irony, of course, is that the purpose of the ANDA application process was to speed the entry of generic drugs. This policy was reaffirmed in 2003 when Congress amended the Hatch-Waxman Act in the Medicare Modernization Act. As the Senate Report explained, those amendments sought in part to stamp out the "abuse" of Hatch-Waxman Act resulting from "pacts between big pharmaceutical firms and makers of generic versions of brand name drugs, that are intended to keep lower cost drugs off the market." Indeed, Senator Hatch, one of the Act's co-authors, stated during the debate over these amendments that

"[a]s a coauthor of the Drug Price Competition and Patent Term Restoration Act, I can tell you that I find these types of reverse payment collusive arrangements appalling. I must concede, as a drafter of the law, that we came up short in our draftsmanship. We did not wish to encourage situations where payments were made to generic firms not to sell generic drugs and not to allow multi-source generic competition."

Experience Shows that Brand-Name Companies and Generic Applicants Do Not Need to Use Payments for Delay to Settle Patent Litigation.

As noted above, the FTC has reported that these types of patent settlements reappeared in 2005, after a six year hiatus. Two observations can be made from this fact. First, the FTC reported that in 1999 its investigations into the legality of these types of settlement agreements became public. The result of this public knowledge was that brand-name and generic companies stopped entering into patent settlement agreements with these terms. Second, brand-name and generic companies continued to settle patent disputes during this period (roughly from 1999 to 2005), when many industry participants believed it to be anticompetitive to enter into these types of patents settlements. This fact undermines any contention now that these payments are necessary to settle patent litigation.

The Courts are Unlikely to Provide Timely Relief to Consumers.

We encourage Congress to act now to end the use of these types of settlement agreements because it is unlikely the federal courts will provide consumers relief in a timely manner. At least two recent appellate court decisions have taken a lenient view of these types of patent settlements, with one of the courts rejecting the reasoned antitrust analysis of these settlements put forth by the FTC. Both courts have, in essence, held that these settlements are legal unless the patent was obtained by fraud or that the infringement suit itself was a sham. These courts relied on the presumptive validity of a patent to support the conclusion that any settlement which does not exceed the exclusionary scope of a patent also must be valid. The upshot of these court rulings is that a patent holder can pay whatever it takes to buy off a potential challenger during the life of the patent. In one sense, court approval of these types of payments will convert Hatch-Waxman into a vehicle for facilitating the collection of "greenmail" by generic applicants.

These rulings are based on two faulty premises. First these courts seem to require that unless the patent can be proved to be invalid or not infringed, a court cannot declare a settlement illegal. This test, as the FTC discussed in its *Schering* opinion, may be good in theory but, it is nearly impossible to make work from a practical point of view.

The second faulty premise is that these courts have elevated the generally held principle that public policy favors settlements above the statutory mechanisms that Congress put in place to encourage generic applicants to challenge weak patents and, hence, speed generic entry. This reasoning also lacks an appreciation of the view, as recently articulated by the U.S. Department of Justice Antitrust Division, that public policy also strongly favors ridding the economy of invalid patents, which impede efficient licensing, hinder competition, and undermine incentives for innovation.

Indeed, the industry experience under Hatch-Waxman between 1992 and 2000 shows that Congress struck the right balance when it established these incentives. During this period, generic challengers that had used paragraph IV certifications won their patent challenges in 73% of the cases. Indeed, these challenges have resulted in generic entry earlier than what otherwise would have occurred absent the generic challenge. These patent challenges and subsequent generic entry have yielded enormous benefits to consumers.

Although the FTC remains vigilant in searching for appropriate ways to take enforcement action against these types of patent settlements, administrative law enforcement actions and appeals take several years to complete. During this time, consumers will be denied access to affordable drugs.

Evaluating Newer Sedative Drugs Used to Treat

Insomnia

Comparing Effectiveness, Safety, and Price

Insomnia is a common problem. About 10% to 15% of adults have persistent problems falling or staying asleep. And a third report at least one episode of insomnia per year. A variety of sleeping pills are available, including several newer drugs that have been heavily promoted to doctors and consumers in recent years.

To help you and your doctor choose the sleeping pill that is right for you – if you need one – *Consumer Reports* has evaluated the drugs in this category based on their effectiveness, safety, and cost. This 2-page brief is a summary of an 18-page comprehensive report you can access on the internet at ConsumerReportsHealth.org/BestBuyDrugs. You can also learn about other categories of drugs we've analyzed on this *free* Web site. Our independent evaluations are based on scientific reviews conducted by the Oregon Health and Science University-based Drug Effectiveness Review Project. *Consumer Reports Best Buy Drugs* is partially funded by a grant from the Attorney General Consumer and Prescriber Education Grant Program.

DO YOU NEED A SLEEPING PILL?

Sleeping pills can be helpful if you have short-term insomnia for a few nights. They reduce the time it takes you to get to sleep, and they help you stay asleep. But sleeping pills are not a long-term solution for people who suffer frequent bouts of insomnia or who have trouble sleeping most nights. Such people should see a physician, preferably a sleep specialist, and be treated with behavioral techniques.

Our Recommendations

Four newer drugs used to treat insomnia — zolpidem (Ambien and Ambien CR), eszopiclone (Lunesta), ramelteon (Rozerem), and zaleplon (Sonata) — are effective. But these medicines are not necessarily better than older, less expensive drugs for many people who need a sleep aid for a night or two. For example, non-prescription drugs containing antihistamines (Benadryl, Nytol, Tylenol PM, and Sominex) and older prescription sedatives called benzodiazepines may work just as well. Among the benzodiazepines approved as sleep aids are estazolam (ProSom), flurazepam (Dalmane), and temazepam (Restoril).

However, we recommend that both the older and newer sleeping pills be taken more judiciously and less often than appears to be the current pattern of use by millions of people in the U.S. There are two main reasons for that advice:

- People with only mild insomnia may be relying too heavily on pills and not trying to address their sleep problems with non-drug measures.
- Insomnia medicines have side effects, can cause dependency, and even worsen your sleeping problems when abused or misused. The possible side effects include daytime sleepiness, cognitive impairment, dizziness, and rebound insomnia. Sleep-walking, memory lapses, and hallucinations have also been reported.

People with chronic insomnia — three or more nights a week for months on end — do need treatment. We advise behavioral therapy that improves sleep habits, possibly combined with occasional use of sleeping pills.

For the average person seeking short-term help we suggest trying an over-the-counter sleep aid first. If that doesn't work, our comparison of the newer drugs led us to chose zolpidem as a *Best Buy*. This is the less expensive generic version of the drug Ambien.

This information was last updated in July 2008.

Effectiveness and Differences – The Newer Sedative Drugs

Drug and Year it Went on Market	Helps You Fall Asleep?	Average Time to Fall Asleep ¹	Helps You Stay Asleep?	Percent With Next-Day Drowsiness ¹	Risk of Rebound Insomnia? ²	Risk of Dependency
Zolpidem (Ambien) (1992)	Yes	33 to 46 minutes	Yes	2%-3%	Yes	Yes
Ambien CR (2005)	Yes	NA	Yes	15%	Yes	Yes
Lunesta (2004)	Yes	50 minutes	Yes	8% to 10%	Yes	Yes
rem (2005)	Yes	75 minutes	No information	5%	No	No
Sonata (1999)	Yes	36 to 55 minutes	Evidence weaker than for zolpidem and Lunesta	5%-6%	No	Yes

¹ As assessed in one major study or, if range given, several studies. Figures are not meant to imply that drugs were necessarily compared to each other in a study with consistent design.

² Rebound insomnia occurs when you stop taking a sleeping pill and the insomnia gets worse. The risk of rebound insomnia is generally small, though some people are vulnerable. When experienced, it usually goes away in a few days.

Costs of Selected Insomnia Drugs ¹				
Generic Name ²	Brand Name	Is a Generic Drug?	Average Cost for 7 Doses ³	Average Cost for 15 Doses ³
Newer Sedatives				
 Zolpidem 5mg	Generic	Yes	\$16	\$35 ⁴
 Zolpidem 10mg	Generic	Yes	\$15	\$33 ⁴
Zolpidem 5mg	Ambien	No	\$41	\$88
Zolpidem 10mg	Ambien	No	\$40	\$86
Zolpidem 6.25mg sustained release	Ambien CR	No	\$37	\$78
Zolpidem 12.5mg sustained release	Ambien CR	No	\$36	\$77
Eszopiclone 1mg	Lunesta	No	\$45	\$96
Eszopiclone 2mg	Lunesta	No	\$44	\$93

Zaleplon 5mg	Sonata	No	\$36	\$78
Zaleplon 10mg	Sonata	No	\$35	\$76
Selected Antidepressant				
Trazodone 50mg	Desyrel	No	\$15	\$32
Trazodone 100mg	Desyrel	No	\$30	\$63
Trazodone 50mg	Generic	Yes	\$3	\$5
Trazodone 100mg	Generic	Yes	\$3	\$5
Selected Benzodiazepines⁵				
Estazolam 2mg	ProSom	No	\$15	\$32
Estazolam 2mg	Generic	Yes	\$7	\$15
Flurazepam 15mg	Dalmane	No	\$13	\$29
Flurazepam 15mg	Generic	Yes	\$3	\$6
Lorazepam 1mg	Ativan	No	\$17	\$35
Lorazepam 2mg	Ativan	No	\$25	\$53
Lorazepam 1mg	Generic	Yes	\$4	\$8
Lorazepam 2mg	Generic	Yes	\$5	\$10
Quazepam 15mg	Doral	No	\$34	\$73
Temazepam 15mg	Restoril	No	\$55	\$117
Temazepam 30mg	Restoril	No	\$57	\$123
Temazepam 15mg	Generic	Yes	\$3	\$6
Temazepam 30mg	Generic	Yes	\$4	\$8
Triazolam 0.25mg	Halcion	No	\$15	\$33
Triazolam 0.25mg	Generic	Yes	\$4	\$10

UNDERSTANDING GENERICS: A generic drug is one that is sold under its generic name. For example in this table, zolpidem is the generic name and Ambien is the brand name. Generics are less expensive. If you are prescribed a brand-name drug that is available as a generic, ask your doctor or pharmacist if switching would be appropriate.

- Not all doses are listed due to space limitations. For a comprehensive list, see our full 18-page report for free at ConsumerReportsHealth.org/BestBuyDrugs.
- All the medicines listed are tablets or capsules. Recommended use is typically one pill at bedtime.
- Prices reflect nationwide retail average for January 2008, rounded to the nearest dollar. Prices are derived by Consumer Reports Best Buy Drugs from data provided by Wallers Kluwer Health, Pharmaceutical Audit Suite®. Wallers Kluwer is not involved in our analysis or recommendations.
- A spot check of online pharmacies indicates varying prices for generic zolpidem, with some sites offering it for \$15 to \$18 for 30 pills.
- Those approved by the FDA for treating insomnia. Selected doses only.

Note: This brief was made possible in part by a grant from the Attorney General Consumer and Prescriber Education Grant Program, which is funded by the multi-state settlement of consumer fraud claims regarding the marketing of the prescription drug Neurontin.

Mr. JOHNSON. Thank you, sir.
Mr. Dickey, proceed.

**TESTIMONY OF BRET M. DICKEY, SENIOR VICE PRESIDENT,
COMPASS LEXECON, OAKLAND, CA**

Mr. DICKEY. Chairman Johnson, Ranking Member Coble, and Members of the Subcommittee, I appreciate the opportunity to testify today.

I have spent the last 10 years analyzing the economics of competition policy, with a particular focus on the pharmaceutical industry. Recently, I co-authored a paper with Laura Tyson, the former chair of President Clinton's National Economic Council, and Jonathan Orszag, a colleague at Compass Lexecon and also a former adviser to President Clinton, that presents an economic framework—

Mr. JOHNSON. Mr. Dickey, if you would put that mike on and move it close to you so that everyone can hear you.

Mr. DICKEY. Is that better?

Mr. JOHNSON. Thank you. Yes.

Mr. DICKEY [continuing]. That presents an economic framework for evaluating such settlements. I have included that paper as an appendix to my written testimony.

Our paper demonstrates that patent settlements between branded and generic manufacturers, even settlements involving so-called reverse payments, can be procompetitive.

Competition policy toward the pharmaceutical industry must represent a balance between protecting incentives for manufacturers of branded drugs to innovate and facilitating entry by manufacturers of lower-priced generic drugs.

The current framework for patent litigation between branded and generic pharmaceutical manufacturers, established by the Hatch-Waxman amendments, is an important component of this balance.

In recent years, settlements of Hatch-Waxman litigation involving reverse payments have received close antitrust scrutiny, driven by concerns that such settlements harm consumers by delaying the entry of lower-priced generic drugs. While some such settlements can harm consumers, economic models demonstrate that when the real-world complexities are accounted for, some such settlements can, in fact, benefit consumers.

My paper with Dr. Tyson and Mr. Orszag presents a broad analytical framework for evaluating the competitive effects of these settlements. On the one hand, settlements of litigation, including patent settlements, can provide clear competitive benefits. Litigation imposes substantial costs upon the litigating parties and on society as a whole, costs which can be mitigated through settlement.

Settlements also reduce risk associated with litigation. Because settlements can lower costs and uncertainty, economists widely agree that settlements in general can be procompetitive.

On the other hand, under certain conditions, patent settlements between branded and generic manufacturers can be anticompetitive. Ultimately, the competitive effects of a particular settlement will depend importantly on the underlying strength of the patent.

If the patent is strong and likely to be found valid and infringed, then even a settlement with an agreed-upon entry date well into the future but before patent expiration may bring generic drugs to market sooner than continued litigation and generate lower prices for consumers.

In contrast, if the patent is weak and likely to be found invalid and/or non-infringed, then even a settlement with an entry date not far in the future may delay entry and harm consumers.

Assessing the strength or weakness of a patent in real-world patent litigation is complex; indeed, the precise strength of a patent is subject to the uncertainties of the litigation system and is ultimately unknowable even to the parties themselves. Nevertheless, such an assessment is necessary at some level in determining whether a patent settlement is pro-or anticompetitive.

Some analysts contend that reverse payments are on their face evidence that the settlements are nothing more than a payment by the brand manufacturer to delay generic entry, but reverse payment is a misnomer based on flawed logic.

In contrast to a “typical” patent case, where the alleged infringer is already selling a product and the patent-holder is suing for damages, in patent suits between branded and generic pharmaceutical manufacturers, the generic has typically not entered the market and the branded manufacturer is suing for a remedy akin to injunctive relief. In this case, there is no a priori expectation that a payment should flow from the generic manufacturer to the branded manufacturer.

The use of overly simple economic models can inappropriately lead to the conclusion that reverse payment settlements will always reduce competition. But these economic models ignore important economic realities that can make reverse payment settlements procompetitive.

Such realities include, but are not limited to: risk aversion, that is, concern by one or both of the parties about the uncertainty surrounding the litigation process; information asymmetries, that is, information that is available to one of the parties but not to the other; differences in expectations, such as the parties’ beliefs about their chances of winning the patent litigation; or differences in discount rates, that is, the relative value of future income relative to present income.

More realistic economic models that consider these factors demonstrate that patent settlements involving reverse payments can be procompetitive. In fact, under certain conditions, without a payment from the branded manufacturer to the generic manufacturer, the parties will be unable to reach agreement on a settlement, even if that settlement would benefit consumers.

A ban on all settlements where some compensation is provided to the generic manufacturer would deprive consumers of the benefits of such settlements.

Moreover, competition policy toward patent settlements can have important effects on both the incentives of branded manufacturers to innovate and on the incentives of generic manufacturers to challenge branded patents. Importantly, a broad ban on reverse payment settlements would reduce the ability of generic manufacturers to settle patent cases and increase the risk and cost of litigation and, therefore, the risk and cost of bringing generic drugs to market prior to patent expiration. On the margin, this will lower the incentives of generic pharmaceutical manufacturers to challenge branded patents in the first place.

Designing a workable framework that distinguishes procompetitive settlements from anticompetitive is difficult, in part because at its core it depends upon the validity of the patent claims.

Mr. JOHNSON. Mr. Dickey, if you could sum up, I would appreciate it.

Mr. DICKEY. What is clear is that, under many circumstances, patent settlements between branded and generic manufacturers, even those involving reverse payments, can benefit competition and consumers. An outright prohibition of reverse payment settlements would harm consumer welfare in a range of circumstances.

Thank you again for the opportunity to discuss this issue with the Subcommittee.

[The prepared statement of Mr. Dickey follows:]

PREPARED STATEMENT OF BRET M. DICKEY

Testimony of Bret M. Dickey, Ph.D.

Senior Vice President, Compass Lexecon

Hearing on "Pay to Delay: Are Patent Settlements That Delay Generic Drug Market
Entry Anticompetitive?"

Before the
Subcommittee on Courts and Competition Policy
Committee on the Judiciary
U.S. House of Representatives

June 3, 2009

Chairman Johnson, Ranking Member Coble, and Members of the Subcommittee, good morning. My name is Bret Dickey and I am a Senior Vice President with Compass Lexecon, an economic consulting firm specializing in competition policy. I appreciate the opportunity to testify today.

Since receiving my Ph.D. in Economics from Stanford University, I have spent the last 10 years analyzing the economics of competition policy, with a particular focus on the pharmaceutical industry. During that period I have analyzed the competitive effects of several patent settlement agreements between branded and generic manufacturers.¹ Recently, I co-authored a paper with Laura Tyson, the former chair of President Clinton's National Economic Council, and Jonathan Orszag, a colleague at Compass Lexecon and a former advisor to President Clinton, that presents an economic framework for evaluating such settlements.² Our paper demonstrates that patent settlements between branded and generic manufacturers, even settlements involving "reverse payments," can be procompetitive.

Consumers benefit from the availability of innovative new products and from lower prices. In the pharmaceutical industry, both the development of new medicines and price competition from manufacturers of generic drugs provide substantial consumer benefits. Competition policy towards the pharmaceutical industry must therefore represent a balance between protecting incentives for manufacturers of branded drugs to innovate and facilitating entry by manufacturers of lower-priced generic drugs.

¹ I have consulted with both brand and generic pharmaceutical manufacturers on cases regarding the competitive effects of patent settlements. The views I express here are solely mine and do not necessarily represent the views and opinions of Compass Lexecon or its clients.

² Bret Dickey, Jonathan Orszag, and Laura Tyson, "An Economic Assessment of Patent Settlements in the Pharmaceutical Industry," March 2009. This testimony draws substantially from that paper, which I include as an Appendix.

The current framework for patent litigation between branded and generic pharmaceutical manufacturers, established by the Hatch-Waxman Amendments in 1984, is an important component of this balance. Generic manufacturers must notify branded manufacturers before launching a potentially infringing generic product, providing branded manufacturers an opportunity to sue for patent infringement before the generic enters the market. In many cases, litigation is resolved with a settlement between the parties. These settlements may include a wide variety of provisions, such as:

- A negotiated date upon which the generic manufacturer will enter the market (with or without royalty payments to the branded manufacturer);
- Cash payments from the branded manufacturer to the generic;
- Business transactions between the branded and generic manufacturer such as cross-licensing or supply agreements; and
- Agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry.

In recent years, patent settlements involving “reverse payments” from branded manufacturers to generic manufacturers have received close antitrust scrutiny, driven by concerns that such settlements harm consumers by delaying the entry of lower-priced generic drugs. Yet economic models demonstrate that when the real-world complexities of litigation are accounted for such settlements can in fact benefit consumers. My paper with Dr. Tyson and Mr. Orszag presents a broad analytical framework for evaluating the competitive effects of these settlements.

On the one hand, settlements of litigation – including patent settlements – can provide clear competitive benefits. Litigation imposes substantial costs upon the litigating parties and on society as a whole, costs which can be mitigated through settlement. Settlements also reduce risk associated with litigation. Because settlements can lower costs and uncertainty, economists agree that settlements can be procompetitive.

On the other hand, under certain conditions, patent settlements between branded and generic manufacturers can be anticompetitive. Ultimately, the competitive effects of a particular settlement will depend importantly upon the underlying strength of the patent. If the patent is strong, and likely to be found valid and infringed, then even a settlement with an agreed-upon entry date well into the future but before patent expiration may bring generic drugs to market sooner than continued litigation and generate lower prices for consumers. In contrast, if the patent is weak, and likely to be found invalid and/or non-infringed, then even a settlement with an entry date not far in the future may delay generic entry and harm consumers. Assessing the strength or weakness of a patent in real-world patent litigation is complex – indeed, the precise strength of a patent is subject to the uncertainties of the litigation system and is ultimately unknowable even to the parties themselves. Nevertheless, such an assessment is necessary at some level in determining whether a patent settlement is pro- or anticompetitive.

While the procompetitive nature of patent settlements is generally recognized by economists, antitrust agencies, and the courts, one category of settlements – so called “reverse payment” settlements – has generated extensive debate in recent years. In these settlements, the parties settle the patent litigation and the branded manufacturer (1) allows the generic manufacturer to enter at or after a particular date in the future (prior to

the expiration of the patent) and (2) pays some form of compensation to the generic manufacturer. That compensation can be in the form of cash or through some other business transaction (*e.g.*, a cross-licensing agreement) which provides a conduit through which the branded manufacturer might allegedly “overpay” the generic manufacturer.

Some analysts contend that such “reverse payments” are on their face evidence that the settlements are nothing more than a payment by the brand manufacturer to delay generic entry. They argue that in what one might think of as the “typical” patent settlement case, the defendant (an alleged patent infringer) makes a payment to the plaintiff (the holder of the patent). But in “reverse payment” settlements, they argue that the payment flows the “wrong” way, from the patent holder (the branded manufacturer and plaintiff) to the defendant (the generic manufacturer and alleged infringer).

“Reverse payment” is a misnomer based on flawed logic. In contrast to a “typical” patent case, where the alleged infringer is already selling a product and the patent holder is suing for damages, in patent suits between branded and generic pharmaceutical manufacturers, the generic has typically not entered the market and the branded manufacturer is suing for a remedy akin to injunctive relief. In this case, there is no *a priori* expectation that a payment should flow from the generic manufacturer to the branded manufacturer.

The use of overly simple economic models can inappropriately lead to the conclusion that “reverse payment” settlements will always reduce competition. But these economic models ignore important economic realities that can make “reverse payment” settlements procompetitive. Such realities include, but are not limited to:

- (a) risk aversion, that is, concern by one or both of the parties over the uncertainty of the litigation process,
- (b) information asymmetries, that is, information that is available to one of the parties but not to the other,
- (c) differences in expectations, such as the parties' beliefs about their chances of winning the patent litigation, and
- (d) differences in discount rates, that is, the relative value of future income relative to present income.

More realistic economic models that consider these factors demonstrate that patent settlements involving “reverse payments” can be procompetitive. In fact, under certain conditions, without a payment from the branded manufacturer to the generic manufacturer, the parties will be unable to reach agreement on a settlement – even if that settlement would benefit consumers. A ban on all patent settlements where some compensation is provided to the generic manufacturer would deprive consumers the benefits of such settlements.

Moreover, competition policy towards patent settlements can have important effects both on the incentives of branded manufacturers to innovate and on the incentives of generic manufacturers to challenge branded patents. A broad ban on “reverse payment” settlements would narrow the patent protection provided to branded manufacturers and, on the margin, lower incentives to invest in new medicines in the future. Importantly, such a ban would also reduce the ability of generic manufacturers to settle such cases and increase the cost and risk of litigation – and therefore the cost and risk of bringing a generic drug to market prior to patent expiration. On the margin, this will lower the

incentives of generic pharmaceutical manufacturers to challenge branded patents in the first place. Even if the effect on a particular generic manufacturer's decision is relatively small, the collective impact on future generic competition could be substantial.

Designing a workable framework that distinguishes procompetitive settlements from anticompetitive settlements is difficult – in part because at its core it depends upon the validity of the patent claims. What is clear is that under many circumstances, patent settlements between branded and generic manufacturers – even those involving “reverse payments” – can benefit competition and consumers. An outright prohibition of “reverse payment” settlements would harm consumer welfare in a range of circumstances.

“Reverse payment” settlements can be anticompetitive and should continue to be closely scrutinized by the antitrust authorities and the courts. Indeed, current law requires that the terms of any patent settlement agreement between a branded pharmaceutical company and a generic applicant be provided to the Federal Trade Commission and the Department of Justice. But a law that would paint all such settlements with the same brush is likely to harm consumers. Instead, more individualized treatment is appropriate, whereby the competitive effects of a particular settlement are evaluated by applying an economic framework to the facts specific to that settlement.

Thank you again for the opportunity to discuss this issue with the Subcommittee.

The views and opinions expressed in this study are solely those of the authors and do not necessarily reflect the views and opinions of PhRMA or any of the organizations with which the authors are or have previously been associated. Compass Lexecon has served as economic consultants to branded and generic manufacturers regarding the competitive effects of patent settlements.

Executive Summary

- Consumers benefit from the availability of innovative new products and from lower prices. In the pharmaceutical industry, both the development of new medicines and price competition from manufacturers of generic drugs provide substantial consumer benefits. Competition policy towards the pharmaceutical industry must therefore represent a balance between protecting incentives for manufacturers of branded drugs to innovate and facilitating entry by manufacturers of lower-priced generic drugs.
- The current framework for patent litigation between branded and generic pharmaceutical manufacturers, established by the Hatch-Waxman Amendments in 1984, is an important component of this balance. Generic manufacturers must notify branded manufacturers before launching a potentially infringing generic product, providing branded manufacturers an opportunity to sue for patent infringement before the generic enters the market. In many cases, litigation is resolved with a settlement between the parties. These settlements may include the following types of provisions:
 - A negotiated date upon which the generic manufacturer will enter the market (with or without royalty payments to the branded manufacturer);
 - Cash payments from the branded manufacturer to the generic;
 - Business transactions between the branded and generic manufacturer such as cross-licensing or supply agreements; and
 - Agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry.
- In recent years, patent settlements between branded and generic manufacturers involving “reverse payments” from branded manufacturers to generic manufacturers have received close antitrust scrutiny, driven by concerns that such settlements harm consumers by delaying the entry of lower-priced generic drugs. It appears that such settlements will be a focus of the Obama Administration’s antitrust enforcement policy. Yet there is a growing consensus among the courts that such settlements are anticompetitive only under narrow sets of circumstances. This paper presents an analytical framework for evaluating the competitive effects of these settlements.
- On the one hand, settlements of litigation – including patent settlements – can provide clear competitive benefits. Litigation imposes substantial costs upon the litigating parties and on society as a whole. Settlements also reduce risk associated with litigation. Because settlements can lower costs and uncertainty, economists agree that settlements can be procompetitive.
- On the other hand, under certain conditions, patent settlements between branded and generic manufacturers can be anticompetitive. Ultimately, the competitive effects of a particular settlement will depend importantly upon the underlying strength of the

patent. If the patent is strong, and likely to be found valid and infringed, then even a settlement with an agreed-upon entry date well into the future but before patent expiration may bring generic drugs to market sooner than continued litigation and generate lower prices for consumers. In contrast, if the patent is weak, and likely to be found invalid and/or non-infringed, then even a settlement with an entry date not far in the future may delay generic entry and harm consumers. Assessing the strength or weakness of a patent in real-world patent litigation is complex – indeed, the precise strength of a patent is subject to the vagaries of the litigation system and is ultimately unknowable even to the parties themselves. Nevertheless, such an assessment is necessary at some level in assessing whether a patent settlement is pro- or anticompetitive.

- While the procompetitive nature of patent settlements is generally recognized by economists, antitrust agencies, and the courts, one category of settlements – so called “reverse payment” settlements – has generated extensive debate in recent years. In these settlements, the parties settle the patent litigation and the branded manufacturer (1) allows the generic manufacturer to enter at or after a particular date in the future (prior to the expiration of the patent) and (2) pays some form of compensation to the generic manufacturer. That compensation can be in the form of cash or through some other business transaction (*e.g.*, a cross-licensing agreement) which provides a conduit through which the branded manufacturer might allegedly “overpay” the generic manufacturer.
- The FTC and some antitrust scholars contend that such “reverse payments” are on their face evidence that the settlements are nothing more than a payment by the brand manufacturer to delay generic entry. They argue that in what one might think of as the “typical” patent settlement case, the defendant (an alleged patent infringer) makes a payment to the plaintiff (the holder of the patent). But in “reverse payment” settlements, they argue that the payment flows the “wrong” way, from the patent holder (branded manufacturer/plaintiff) to the defendant (the generic manufacturer and alleged infringers).
- A “reverse payment” is a misnomer based on flawed logic. In contrast to a “typical” patent case, where the alleged infringer is already selling a product and the patent holder is suing for damages, in patent suits between branded and generic pharmaceutical manufacturers, the generic has typically not entered the market and the branded manufacturer is suing for a remedy akin to injunctive relief. In this case, there is no *a priori* expectation that a payment should flow from the generic manufacturer to the branded manufacturer.
- The use of highly simplified economic models can inappropriately lead to the conclusion that “reverse payment” settlements will always reduce competition. But overly simple economic models ignore important economic realities that can make reverse payment settlements procompetitive. Such realities include, but are not limited to, (a) risk aversion, (b) information asymmetries, (c) differences in expectations, and (d) differences in discount rates. In fact, under certain conditions,

without a payment from the branded manufacturer to the generic manufacturer, the parties will be unable to reach agreement on a settlement – even if that settlement would benefit consumers.

- For example, suppose that both the branded and generic manufacturers are overly optimistic about their chances of success in the patent litigation – say the branded manufacturer believes that there is a 75-percent chance that it will win the litigation and the generic manufacturer believes that there is a 75-percent chance that it will win. In this case, the parties will be unable to reach a settlement based upon entry date alone. A reverse payment, however, can facilitate a settlement that is agreeable to both parties and, given the actual chance of success in the patent litigation based on the strength of the underlying patent, provide benefits to consumers relative to continued litigation.
- Other examples of circumstances in which settlement is not possible without compensation between the parties will be discussed in more detail in the report.
- Moreover, competition policy towards patent settlements can have important effects both on the incentives of branded manufacturers to innovate and on the incentives of generic manufacturers to challenge branded patents. Taking some potentially procompetitive settlement options off the table would narrow the patent protection provided to branded manufacturers and, on the margin, lower incentives to invest in new medicines in the future. This would also reduce the ability of generic manufacturers to settle such cases and increase the cost and risk of bringing a generic drug to market. On the margin, this will lower the incentives of generic pharmaceutical manufacturers to challenge branded patents in the first place. Even if the effect on a particular generic manufacturer’s decision is relatively small, the collective impact on future generic competition can be substantial.
- Despite the contention by some that reverse payment settlements should be treated as *per se* illegal, courts, the Department of Justice (DOJ), and many economists have concluded that patent settlements between pharmaceutical manufacturers can be procompetitive and should be given considerable latitude.
 - Decisions by the Second, Eleventh, and most recently the *Cipro* decision by the Federal Circuit Court of Appeals have all concluded that patent settlement agreements between branded and generic pharmaceutical manufacturers – even agreements involving reverse payments – are appropriately treated under a rule of reason standard and are not anticompetitive as long as the agreement is not beyond the exclusionary scope of the patent and the litigation is not objectively baseless.
 - The DOJ has stated that “...settlements between an ANDA filer and the patent holder [even those with a reverse payment] also can benefit consumer welfare. Accordingly, the Department of Justice does not believe *per se* liability under the

antitrust laws is the appropriate standard.” Economists have reached similar conclusions.

- Designing a workable framework that distinguishes procompetitive settlements from anticompetitive settlements is difficult – in part because at its core it depends upon the validity of the patent claims. What is clear is that under many circumstances, patent settlements between branded and generic manufacturers – even those involving reverse payments – can benefit competition and consumers. An outright prohibition of reverse payment settlements would harm consumer welfare in a range of circumstances. Patent settlements between branded and generic pharmaceutical manufactures can be anticompetitive and should continue to be closely scrutinized by the antitrust authorities and the courts. Indeed, current law requires that the terms of any patent settlement agreement between a branded pharmaceutical company and a generic applicant be provided to the FTC and the DOJ. But painting all settlements with the same brush is likely to harm consumers. Instead, more individualized treatment is appropriate, whereby the competitive effects of a particular settlement are evaluated by applying an economic framework, such as that presented here, to the facts specific to that settlement.

Introduction

In recent years, the Federal Trade Commission (“FTC”) has been closely scrutinizing patent settlements between branded and generic manufacturers involving “reverse payments” from branded manufacturers to generic manufacturers. The FTC has been concerned that such settlements harm consumers by delaying the entry of lower-priced generic drugs.

Despite what appears to be a growing consensus among the courts that such settlements are anticompetitive only under narrow sets of circumstances, it is likely that antitrust scrutiny will only increase in the next several years. In 2007, then-Candidate Obama specifically pointed to concerns over such settlements in laying out his views on antitrust enforcement policy.⁵ Jon Leibowitz, the current Chairman of the Federal Trade Commission, recently called eliminating anticompetitive patent settlements “one of the most important objectives for antitrust enforcement in America today.”⁶ Bills that would outlaw settlements involving payments from branded to generic manufacturers were introduced in the U.S. Senate and House of Representatives in recent months.⁷

In this paper, we present an analytical framework for evaluating the competitive effects of patent settlements, including those involving reverse payments, and demonstrate that these settlements can benefit consumers. Thus, we conclude that while continued scrutiny of such settlements is important, broad brush treatments are inappropriate and only a more individualized evaluation can correctly determine the competitive effects of a particular settlement agreement.

I. COMPETITION IN THE PHARMACEUTICAL INDUSTRY

Innovative branded pharmaceutical firms can benefit consumers by developing new drugs. Generic pharmaceutical firms can benefit consumers by offering competition

⁵ Statement of Senator Barack Obama for the American Antitrust Institute, September 2007, p. 2 (available at http://www.antitrustinstitute.org/archives/files/aii-%20Presidential%20campaign%20-%20Obama%209-07_092720071759.pdf).

⁶ Concurring Statement of Commissioner Jon Leibowitz re: *Federal Trade Commission v. Watson Pharmaceuticals et. al.*, February 2, 2009 (available at <http://www.ftc.gov/speeches/leibowitz/090202watsonpharm.pdf>).

⁷ The Preserve Access to Affordable Generics Act was introduced by Senators Kohl and Grassley in February 2009 (see http://kohl.senate.gov/newsroom/pressrelease.cfm?custom1_dataPageID_1464=2126), and the Protecting Consumer Access to Generic Drugs Act of 2009 was introduced by Representative Rush in March 2009 (see http://thomas.loc.gov/home/epo.xmlc111/h1706_ih.xml).

that drives down prices. Thus, the challenge of competition policy in this area (as in all highly innovative industries) is to benefit consumers by striking the appropriate balance between providing sufficient rewards to encourage innovation, followed after a time by a transition to a more competitive market with lower prices.

A. Innovation and Patent Protection

Innovation is the lifeblood of the pharmaceutical industry. In 2007, the pharmaceutical and biotechnology industries invested nearly \$60 billion in research and development (“R&D”).⁸ As described by the Congressional Budget Office (“CBO”):

The pharmaceutical industry is one of the most research-intensive industries in the United States. Pharmaceutical firms invest as much as five times more in research and development, relative to their sales, than the average U.S. manufacturing firm.⁹

Since 1990, R&D by pharmaceutical manufacturers has led to the approval of an average of roughly 30 new drugs (molecular entities) and dozens of newly approved formulations or other modifications of existing drugs each year.¹⁰

Protection of the intellectual property underlying these innovations is critical to providing incentives for pharmaceutical manufacturers to continue to invest in, and develop, new drugs. The research and development process is lengthy, costly, and uncertain. Only a tiny fraction of medicines tested are eventually approved for patient use,¹¹ and only 20 to 30 percent of those approved eventually recoup their R&D

⁸ Pharmaceutical Research and Manufacturers of America, *Pharmaceutical Industry Profile 2008*, March 2008, pp. 2-3. See also Congressional Budget Office, “Research and Development in the Pharmaceutical Industry,” October 2006, pp. 7-9 (“CBO 2006”).

¹¹ For example, one report indicates that only 1 of every 5,000 medicines tested is eventually approved (Tufts Center for the Study of Drug Development, “Backgrounder: How New Drugs Move Throughout the Development and Approval Process,” November 1, 2001).

investment.¹² Development of a new drug entails considerable time and expense. These development costs have been rising significantly. Recent studies estimate that the average new drug took 10 to 15 years¹³ and cost over \$1.3 billion (including both direct costs and opportunity costs) to develop.¹⁴ Strong protection of intellectual property, and the potential rewards that come with it, provide incentives for pharmaceutical companies to undertake such large development costs.

B. Generic Competition

After a branded drug loses patent protection (or a generic manufacturer is able to produce a non-infringing generic version), generic manufacturers often bring bioequivalent versions of branded drugs to market. Numerous economic studies have consistently found that entry of a competing generic manufacturer typically leads to lower average prices, and that this price competition typically intensifies with the entry of additional manufacturers.¹⁵ For example, the CBO concluded in a review of the evidence that:

The dramatic rise in generic sales since 1984 has held down average prices for drugs that are no longer protected by a

See also CBO 2006, and Adams, Christopher P. and Brantner, Van V., "Estimating the Cost of New Drug Development: Is It Really \$802 Million?" *Health Affairs*, 25(2), 2006, pp. 420-428.

¹⁵ See, for example, Grabowski, Henry G. and Vernon, John M., "Brand Loyalty, Entry and Price Competition in Pharmaceuticals After the 1984 Drug Act," *Journal of Law and Economics*, 35, October 1992, pp. 331-350. Other articles reaching similar findings include: Frank, R. G. and Salkever, D. S., "Pricing, Patent Loss and the Market for Pharmaceuticals," *Southern Economic Journal*, 59(2), 1992, pp. 165-179; Caves, Richard E., Whinston, Michael D., and Hurwitz, Mark A., "Patent Expiration, Entry, and Competition in the U.S. Pharmaceutical Industry," *Brookings Papers on Economic Activity: Microeconomics*, 1991, pp. 1-48; Congressional Budget Office, "How Increased Competition from Generic Drugs Has Affected Prices and Returns in the Pharmaceutical Industry," July 1998, pp. 28-33 ("CBO 1998"). As Grabowski and Vernon (1992) and others have found, branded manufacturers may increase their prices in response to generic entry, but the net effect of lower generic prices and higher branded prices is generally to lower average prices for the molecule.

patent. ...[A]verage prices fall primarily because consumers switch from the higher-priced innovator drug to the lower-priced generics. To be on the receiving end of that switch, generic manufacturers compete with each other intensely in the area of price, partly because they sell identical products. The increased use of generic drugs has kept total spending on prescription drugs below what it might otherwise have been.¹⁶

As the next section discusses, given the significant consumer benefits that result from both innovation and lower prices, policy-makers have sought to facilitate generic competition within a framework intended to provide branded manufacturers sufficient incentives to innovate.

C. The Hatch-Waxman Amendments

1. Introduction

In 1984, the U.S. Congress passed the Hatch-Waxman Amendments (“Hatch-Waxman”)¹⁷ to the Federal Food, Drug, and Cosmetic Act of 1938, which sought to balance the importance of innovation and generic entry. Hatch-Waxman established the current framework for patent litigation in the pharmaceutical industry, and although this framework has been modified since 1984, it largely remains intact. Any analysis of the economics of patent settlements must begin with an understanding of this framework.

2. FDA approval prior to Hatch-Waxman

Since 1962, the Food and Drug Administration (“FDA”) has required pharmaceutical companies to prove that new branded drugs are “safe and effective” prior to approval. Branded drug manufacturers provide such evidence by conducting costly and lengthy clinical trials. The process of conducting clinical trials and obtaining FDA approval decreases the effective life of pharmaceutical patents substantially, because approval is typically received many years after a patent is granted.¹⁸ Before Hatch-Waxman, the FDA also required generic manufacturers to conduct their own safety and

¹⁶ CBO 1998, p. 13.

¹⁷ More formally, the law was known as the Drug Price Competition and Patent Term Restoration Act of 1984.

¹⁸ CBO 1998, p. 39.

efficacy studies. Generic manufacturers could not begin their safety and efficacy studies until patents on the brand-name drug had expired.

3. *Overview of Hatch-Waxman*

The intent of Hatch-Waxman was to alter the FDA approval process in two important ways:

On the one hand, Hatch-Waxman sought to increase patent protection and to strengthen the incentives of branded manufacturers to innovate. Recognizing that the lengthy FDA approval process often substantially reduced the effective life of pharmaceutical patents, Hatch-Waxman allowed branded manufacturers to apply to extend the life of these patents to regain some of the patent life lost by clinical trials and the FDA approval process.¹⁹

On the other hand, Hatch-Waxman attempted to encourage generic competition. It streamlined the approval process for generic manufacturers, thereby reducing the costs of obtaining FDA approval and speeding their time to market. More specifically, Hatch-Waxman allowed generic pharmaceutical companies to submit an Abbreviated New Drug Application (ANDA), simply referencing the safety and efficacy results submitted by the branded company rather than conducting new clinical trials, so long as the generic drug could demonstrate “bioequivalence,” which means that the rate and extent of absorption of the generic drug is not significantly different from that of the brand-name drug when administered with the same dosage. Branded manufacturers were required to file information about any relevant patents with the FDA. In addition, the ANDA filer must certify one of the following:

- (1) the required patent information has not been filed by the branded manufacturer

¹⁹ Specifically, the branded manufacturer could apply for an extension on one patent equal to half of the time spent on clinical trials plus all of the time spent in FDA review, subject to a maximum extension of five years and a maximum effective patent life of 14 years. See Grabowski, Henry G. and Kyle, Margaret, “Generic Competition and Market Exclusivity Periods in Pharmaceuticals,” *Managerial and Decision Economics* 28, 2007, p. 492. Additionally, regardless of whether a new drug has patent protection, upon approval of an NDA for a New Chemical Entity, a drug will receive a 5-year term of exclusivity from the FDA. During this exclusivity period an ANDA that references the brand manufacturer’s NDA cannot be submitted (except after four years if there is a patent challenge). See: U.S. Food and Drug Administration, “Frequently Asked Questions on Patents and Exclusivity” (<http://www.fda.gov/cder/ob/faqs.htm#How>).

- (2) the patent has expired;
- (3) the patent will expire, identifying the expiration date; or
- (4) the patent is invalid and/or not infringed.

The latter representation is known as a Paragraph IV certification.

Since Hatch-Waxman, competition from generic drugs has grown significantly. The generic share of prescriptions has grown from 19 percent in 1984 to nearly 67 percent today.²⁰

4. Patent litigation under Hatch-Waxman

Hatch-Waxman established several important aspects of patent litigation between branded and generic manufacturers. First, an ANDA filer who makes a Paragraph IV certification that the existing patent is invalid or not infringed must notify the patent holder (and the branded manufacturer) of the basis for its assertion. Under Hatch-Waxman, if a branded manufacturer files suit within 45 days of receiving notice of a Paragraph IV certification, the branded company is granted an automatic stay of FDA final approval of the generic company's ANDA until the earliest of: (1) 30 months from the notification date; (2) the district court decides the patent is invalid or not infringed; or (3) the patent expires. This is commonly known as a "30-month stay." If the patent holder does not file suit within the 45-day window, then the FDA may approve the ANDA immediately, provided all other requirements are met.

Second, the earliest generic pharmaceutical company to file an ANDA with a Paragraph IV certification for a particular drug is awarded a "180-day exclusivity period," during which time the FDA may not approve any Paragraph IV ANDAs filed subsequently for the same drug.²¹ The start of the 180-day exclusivity period is triggered

²⁰ See, for example, Generic Pharmaceutical Association (GPhA), "Annual Report 2008: Generics: The Right Choice for Better Health," 2008, p. 6; GPhA, "Industry History" (available at <http://www.gphaonline.org/Content/NavigationMenu/AboutUS/History.htm>).

²¹ Under certain circumstances (e.g., two generic manufacturers file ANDAs containing a Paragraph IV certification for the same branded drug on the same day) the FDA may grant "shared exclusivity" in which both generic manufacturers can receive final approval simultaneously and potentially share the 180-day exclusivity period.

by commercial marketing of the first filer's product.²² If the first filer does not exercise its exclusivity in a timely fashion, a variety of circumstances can lead to the forfeiture of its eligibility for exclusivity.²³ The substantial profits available during the 180-day period of exclusive marketing (in which the exclusive generic can charge a higher price than it could in the face of competition from other generic manufacturers and capture a larger share of sales) provide generic firms with an additional incentive to be first to challenge potentially invalid patents or to invent around the patented technology by developing a non-infringing alternative.

D. Patent Litigation and Settlement Agreements

ANDA filings frequently result in patent litigation. From 1998 to 2000, roughly 20 percent of filed ANDAs contained Paragraph IV certifications, where the generic manufacturer claimed that the branded manufacturers' patent(s) were invalid or not infringed.²⁴ A study by the FTC of ANDA filings between 1992 and 2000 found that a Paragraph IV certification resulted in patent litigation nearly 75 percent of the time.²⁵

In general, the vast majority of patent litigation is resolved through a settlement between the parties.²⁶ Settlements between branded and generic pharmaceutical manufacturers are common. From 1992 to 2000, nearly 40 percent of litigations against the first ANDA filer resulted in settlement.²⁷ Similarly, Barr, one of the largest generic manufacturers, has settled nearly half of the 30 patent cases that it has been involved with (and the vast majority of cases that are not still pending) in the last 15 years.²⁸

²² For products subject to the prior law before 2003, the 180 days would also be triggered by a court decision of invalidity or noninfringement of the relevant patent.

²³ "Medicare Prescription Drug, Improvement, and Modernization Act of 2003," §1102 (a)(2)(D)(i)(I)(aa)(AA) ("2003 MMA").

²⁷ FTC 2002, pp. 15-16.

²⁸ Testimony of Bruce Downey. "Paying Off Generics to Prevent Competition With Brand Name Drugs: Should It Be Prohibited?" *Hearing Before the Committee on the Judiciary, United States Senate, Serial No. J-110-4*, 2007, p. 23. ("Testimony of Bruce Downey") Specifically, Mr. Downey testified that this has been true during his tenure as CEO, which began in 1993.

These settlements take many forms and can include the following types of provisions:

- An agreed-upon date upon which the generic manufacturer will enter the market (with or without royalty payments to the branded manufacturer);
- Cash payments from the branded manufacturer to the generic;
- Ancillary business transactions such as cross-licensing or supply agreements; and
- Agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry.

Pharmaceutical manufacturers settling patent litigation are required to report information on those settlements to the FTC and DOJ, and the FTC publishes annual reports summarizing those settlements.²⁹ The following table provides a summary of the FTC's classification of settlements that have been entered into over the last several years between branded and generic pharmaceutical manufacturers.³⁰

	Total Settlements	Settlements Allowing Immediate Generic Entry	Settlements Not Allowing Immediate Generic Entry	
			With No Compensation to Generic	With Compensation to the Generic ³¹
FY 2004	14	9	5	0
FY 2005	11	7	1	3
FY 2006	28	8	6	14
FY 2007	33	8	11	14

II. COMPETITIVE EFFECTS OF PATENT SETTLEMENTS: SHORT-RUN

A. Overview

1. Patent settlements reduce the direct and indirect costs of litigation

²⁹ This requirement was created by the 2003 MMA and effective in FY 2004.

³⁰ Federal Trade Commission, "Summary of Agreements Filed in FY 2004," Figure II; Federal Trade Commission, "Summary of Agreements Filed in FY 2005," p. 3; Federal Trade Commission, "Summary of Agreements Filed in FY 2006," pp. 3-4; Federal Trade Commission, "Summary of Agreements Filed in FY 2007," p. 3 and Figure III.

³¹ As defined by the FTC, compensation may be in the form of cash, an ancillary business transaction, or an agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry. According to the FTC reports, many of these settlements also include compensation to the branded manufacturer – the reports do not provide sufficient information to determine whether there was a net payment to the generic.

Settlements of litigation provide clear potential benefits. After all, litigation imposes substantial costs. Costs to litigating parties include (1) direct litigation costs such as legal fees, (2) indirect costs such as requiring attention of company executives and distracting them from their responsibilities of running the business, and (3) indirect costs due to uncertainty.³² Additional costs to society as a whole include increased congestion of the court system and corporate resources focused on private dispute resolution as opposed to innovation and production activities. Moreover, as firms generally pass on at least some portion of costs incurred, consumers ultimately bear some of these costs.

2. Patent settlements have the potential to be anticompetitive

While patent settlements between branded and generic manufacturers have clear potential benefits, they also can harm competition and consumers under certain conditions. The potential for anticompetitive effects is increased when the settlement is with the first generic filer, rather than a subsequent generic filer, and the first filer does not relinquish its exclusivity. As described above, under Hatch-Waxman, the first generic filer receives 180 days of marketing exclusivity. This creates the potential for anticompetitive effect to the extent that delaying entry by the first filer could delay entry by all other generics as well. Prior to 2003, when much of the concern over patent settlements in the pharmaceutical industry originated, a settlement agreement did not affect 180-day exclusivity. Thus, a settlement with a first filer specifying an entry date well into the future could also prevent other generics from entering before that date (unless a subsequent-filing generic obtained a court decision that its product did not infringe or that the patent was invalid. Recognizing the potential anticompetitive effects of such a situation, a 2003 law introduced additional restrictions on “parking” the 180-day exclusivity. Importantly, the law was changed such that if the branded and generic manufacturers reach a settlement agreement, the settlement is challenged by the FTC or DOJ, and the agreement is determined to violate the antitrust laws, then the generic

³² See, for example, Shapiro (2003), p. 394; Bessen, James E. and Meurer, Michael J., “The Private Costs of Patent Litigation,” *2nd Annual Conference on Empirical Legal Studies Paper*, February 1, 2008, p. 2.

manufacturer forfeits its exclusivity.³³ This change substantially lessens the antitrust concerns with such settlements.

Ultimately, the competitive effects of a particular settlement will depend importantly upon the strength of the underlying patent.³⁴ A patent gives the branded manufacturer the right, within certain boundaries, to exclude competition.³⁵ If the patent is quite strong, and likely to be found valid and infringed, then even a settlement with an agreed-upon entry date well into the future but before patent expiration may bring generic drugs to market sooner than the expected outcome from continued litigation and generate lower prices for consumers. Moreover, there are frequently several generic manufacturers challenging a brand-name patent at any given time. Where this is the case, a settlement agreement with the first-filing generic has even less potential for anticompetitive effect where the brand-name patent is weak. While the incentive may not be as strong as that of the first filer (due to the 180-day exclusivity), other generic manufacturers continue to have an incentive to continue their challenge of patents they believe are invalid or that they do not infringe.³⁶

In contrast, if the patent is quite weak, and likely to be found invalid and/or non-infringed, then even a settlement with an entry date not far in the future may delay generic entry and harm consumers. Considering the strength of a patent in real-world patent litigation, at least to some extent, is complex, but necessary. The next section presents an economic framework for this evaluation.

³³ 2003 MMA.

³⁴ Some courts have considered not the subjective assessments of the parties but what a “reasonable person” would think. *See, e.g., Asahi Glass Co., Ltd. v. Pentech Pharm., Inc.*, 289 F. Supp. 2d 986, 992-993.

³⁵ See Shapiro (2003) for a discussion of patents as probabilistic property rights.

³⁶ The 180-day exclusivity provides a motivation for generic manufacturers to bear the cost and risk associated with developing generic versions of branded drugs and challenging branded patents. But at the time of a settlement with the first-filing generic, many subsequent generic entrants may have already incurred many of these costs. Thus, even relatively small profits expected by a subsequent filer could provide the incentive to continue to challenge the branded patent.

B. Economic Framework

1. Basic Model

Determining the scope of patent settlements that could raise antitrust concerns amounts to evaluating the following question: Which settlements would be in the economic interest of both the branded and generic manufacturer, but would harm consumers, relative to continuing litigation? Answering this question requires modeling the settlement decisions of both the branded and generic manufacturers, as well as evaluating the benefit to consumers from generic entry.

The standard economic model of settlements compares each settling party's economic gains from settling to its economic gains from continuing the litigation.³⁷ One then compares these two sets of settlement terms to determine the range of settlement terms that both parties would find preferable to continued litigation – in other words, those settlement terms that would feasibly lead to the end of the litigation.

Once the range of feasible settlements is established, one needs to determine which of these settlements, if any, would benefit consumers.³⁸ After all, consumers are not a party to the settlements, and so one might imagine that there could be settlements which benefit branded and generic manufacturer that do not benefit consumers.

For expositional purposes, we start with a highly simplified model of a patent settlement between branded and generic manufacturer. Assume:

- The parties are considering settlement at the beginning of Year 1
- The patent expires at the end of Year 10
- The generic manufacturer both believes that it has and in fact has a 50 percent chance of winning the patent case (and the branded manufacturer also has, and perceives, a 50 percent chance)
- There are no costs to litigation

³⁷ For a general discussion of the settlement decision, see Cooter, Robert and Rubinfeld, Daniel L., "Economic Analysis of Legal Disputes and their Resolution," *Journal of Economic Literature*, September 1989, pp. 1067-1097.

³⁸ In this paper, the term "consumers" is used to represent those that ultimately pay for prescription drugs. In reality, this is a combination of patients, private insurers, and government.

- The only settlement tool available is the date of generic entry (*i.e.*, lump sum payments, royalty payments, and other business transactions are not allowed).³⁹

As we describe below, many of these assumptions do not affect the conclusions, but rather allow for an easier grasp of the intuition underlying the economic model. Other assumptions will have important effects on the conclusions. In the sections that follow, we will introduce real-world complexities and examine the implications of enriching the model.

Under these original assumptions, the expected or average outcome from litigation is generic entry at the end of Year 5. There is a 50 percent chance of immediate entry if the generic wins and a 50 percent chance of entry at the end of Year 10 if the brand wins. The settlement decision amounts to a comparison of the profits from settling to a simple average of the profits assuming immediate generic entry (50 percent chance the generic wins) and the profits assuming generic entry in Year 10 (50 percent chance the generic loses). Under the assumptions provided above, the simple average of profits from litigation is equivalent to the profits from entry at the end of Year 5.

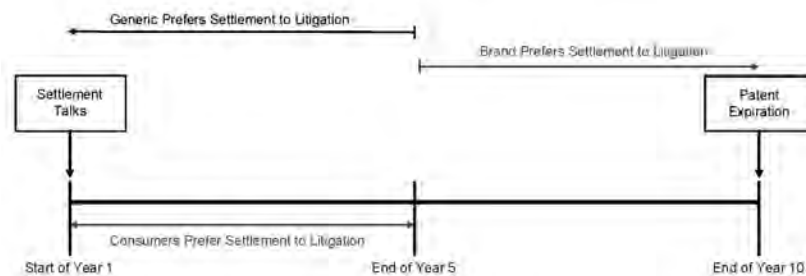

In this simple framework, the only tool the parties can use in settlement negotiations is the date of entry of the generic. As shown in Figure 1, the branded manufacturer would agree to a settlement with generic entry at any point after the end of Year 5, whereas the generic manufacturer would agree to a settlement with generic entry at any point up until the end of Year 5. Thus, no settlement can be mutually agreeable to the two parties. The settlement ranges of the two parties are contiguous, but do not overlap.

Of course, this simple model assumes away many complexities present in the real world – indeed, some of the very complexities that provide important incentives for litigating parties to settle. In the next section, we relax some of these assumptions and

³⁹ Other assumptions include: (1) Total prescriptions are constant in each year, as is the share of prescriptions by the branded and generic manufacturers after generic entry. (2) There is perfect information, so both parties know the ultimate chance of winning. (3) Both parties are risk neutral. (4) There is no time value of money for either party. (5) After entry, there will be only one generic competitor.

demonstrate that doing so leads to a range of reasonable conditions under which patent settlements can benefit consumers.

Figure 1
Settlement with Generic Entry Date

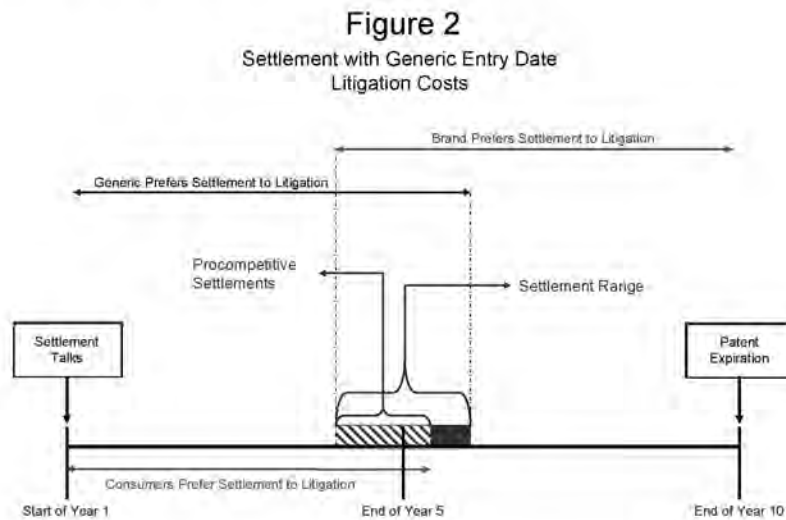

Note: There are no settlements that both the Brand and Generic prefer to Litigation

2. Litigation costs

A primary motivation for parties to settle litigation is that it is costly. The oversimplified model presented above ignores this motivation. We now introduce litigation costs into the model and show that it leads to a range of settlements that would be agreeable to both the branded and generic manufacturers and could also make consumers better off.

Figure 2 shows that, because litigation is costly, the brand-name manufacturer would be willing to accept settlements where the generic enters before the end of Year 5 (*i.e.*, earlier than it would be willing to accept based only on the profits from winning or losing the litigation), because the brand-name manufacturer would avoid these costs. Similarly, the generic would be willing to accept settlements which would have it entering after the end of Year 5 (*i.e.*, later than it would be willing to accept based only on the chance of winning or losing the litigation). These litigation costs enlarge the range

of settlements that would be agreeable to both parties.⁴⁰ In this way, litigation costs create the possibility of some settlements – those that would lead the generic to enter before the end of Year 5 – that would benefit consumers. Accounting for the fact that part of litigation costs are ultimately borne by consumers broadens the range of procompetitive settlements.

Of course, the particular size of settlement ranges shown in these figures is not meant to convey the relative likelihood of any particular type of settlement, but simply to demonstrate the economic logic that certain kinds of settlements exist. Indeed, what seems to be a clear distinction between procompetitive and anticompetitive in these diagrams is in fact quite difficult to distinguish in the real world. Recall that our example

⁴⁰ Because annual profits for the generic are lower than annual pre-generic entry profits for the branded manufacturer, the generic would be willing to give up more time in the market to avoid those costs, assuming litigation costs for the brand and the generic are similar.

assumes a 50 percent chance that the generic manufacturer will win the patent litigation – and that everyone knows that probability. But the precise strength of the patent is not knowable to the antitrust analyst or even the parties themselves. It will depend on a wide range of factors that affect the outcome of litigation, including the documentary evidence, the quality of presentations by counsel, the testimony of company witnesses, the testimony of expert witnesses, and the particular judge and jury assigned to the case. Whereas settlements with entry after Year 5 could harm consumers under the assumptions we have presented, such settlements could in fact be procompetitive if the generic manufacturer’s chance of winning the patent litigation was only, say, 30 percent.

3. *Risk aversion*

Another cost of litigation is the substantial uncertainty that it creates. Economists model the cost of uncertainty using the concepts of “risk aversion” and “risk premiums.”⁴¹ For example, a risk-averse economic actor will prefer to receive \$2 with certainty, rather than a 50 percent chance at \$1 and a 50 percent chance at \$3. That is, risk-averse individuals prefer a certain outcome to uncertain outcomes with the same average or expected value but some degree of variance. A risk premium is the amount of money that a party would pay to avoid taking a risk. In the example above, the risk premium is the amount the individual would pay in order to receive the \$2 with certainty rather than the option with 50-50 odds. The concept of a risk premium allows us to model uncertainty in the same way we do other litigation costs – where the risk premium is the additional cost to the parties created by the uncertainty. Thus, just as in the discussion of litigation costs above, both branded and generic manufacturers would accept lower expected profits under a settlement relative to continued litigation to avoid heightened uncertainty. As shown in Figure 3, the effects are similar to those with litigation costs.⁴²

⁴¹ See Pindyck, Robert S. and Rubinfeld, Daniel L., *Microeconomics*, 7th Edition, 2009, Section 5.2.

⁴² Similarly, if consumers are risk averse, accounting for this would broaden the range of procompetitive settlements.

Figure 3
Settlement with Generic Entry Date
Risk Aversion and Litigation Costs

Is it reasonable to assume that large pharmaceutical companies are risk averse? After all, a basic tenet of financial economics holds that a large firm and/or a firm owned by (and effectively managed for) well-diversified shareholders should be risk neutral. The risk from a particular litigation can be effectively eliminated through diversification—in this case, by investing in many projects or holding many stocks. However, this argument ignores two important realities. First, it ignores the so-called principal-agent problem that can exist between the managers of the firm (in this case, the executives with decision-making power over the decision to settle or continue litigating) and the shareholders of the firm.⁴³ While the firm's shareholders may be risk neutral, because they can diversify their risks over many investments, managers whose jobs and salaries depend to some extent on their current employer may be risk averse, instead. Second, not all pharmaceutical companies – not even all branded manufacturers – are large firms

⁴³ For a general discussion of the principal-agent problem see, for example, Pindyck, Robert S. and Rubinfeld, Daniel L., *Microeconomics*, 7th Edition, 2009, Section 17.4.

owned by diversified shareholders. For some branded manufacturers, the financial health of the company may depend importantly on the success of a single drug line.

4. Information asymmetries

Information asymmetries are another important component of settlement decisions. Both the branded and the generic manufacturer are likely to have information that the other party does not possess. The generic manufacturer, for example, may have better information about its ability to manufacture a generic version of the branded product. For example, a generic manufacturer may have manufacturing problems that delay its entry beyond the point at which it receives FDA approval (or that make such entry less effective). The branded manufacturer would be unlikely to know of such problems at the time of the settlement discussions.

The branded manufacturer, on the other hand, may have better information about the expected size of the market for the product in the future. Branded pharmaceuticals generally have a limited life cycle; a branded drug often faces increasing competition from newer and often more effective branded products. The branded manufacturer may, for example, have specific knowledge of a next-generation product in its development pipeline which could substantially reduce the potential market for the litigated drug in the future.

These are just two examples of information asymmetries; there are many dimensions on which such asymmetries can exist. The parties may have private information that alters their probabilities of winning the patent litigation, about the competitive strategies (*e.g.*, pricing) they plan to employ after generic entry, or other factors.

We now introduce a specific example of information asymmetry to our model. Assume that the generic manufacturer knows that, even if it wins the patent litigation, manufacturing issues will prevent it from launching until the beginning of Year 3 (two years from now). Assume also that the branded manufacturer is unaware of this.

Figure 4
Settlement with Generic Entry Date
Information Asymmetry and Litigation Costs

In this case, as shown in Figure 4, the generic manufacturer would be willing to agree to a settlement with entry as late as Year 6 (even later factoring in litigation costs), which would give it an additional four years of generic profits relative to the scenario when it litigates and loses. This outcome splits the difference between the eight years of additional profits (Year 3 through Year 10) it would receive if it won the litigation, and the zero years if it lost. Similarly, consumers would be better off under a settlement with a date up to and including Year 6. The branded manufacturer, unaware that the generic has any production issues, has the same preferences it did in the initial example: It would agree to any settlement with generic entry as early as Year 5. Thus, as shown in Figure 4, procompetitive settlements with an entry date between Year 5 and Year 6 are feasible (and adding litigation costs or risk aversion to the model would only expand the range of procompetitive settlements).

Litigation costs, risk aversion, and information asymmetries are only three of the potential real-world complexities that can give rise to procompetitive patent settlements

between the branded and generic manufacturer. For example, the preceding section has assumed that both parties have identical expectations as to the outcome of the litigation. It is highly likely, however, that the parties' expectations will differ at least to some extent – and perhaps greatly – and these differences can have important effects on the ability of the parties to reach settlement and the effects of those settlements on consumers. In the next section, we explore these and other issues in the specific context of reverse payment settlements.

III. COMPETITIVE EFFECTS OF REVERSE PAYMENT SETTLEMENTS: SHORT-RUN

A. Overview

While the possibility of the procompetitive nature of patent settlements is generally recognized by economists, antitrust agencies, and the courts, one category of settlements – so-called “reverse payment” settlements – has generated extensive debate in recent years. In these settlements, the parties settle the patent litigation and the branded manufacturer (1) allows the generic manufacturer to enter at or after a particular date in the future (prior to the expiration of the patent) and (2) pays some form of compensation to the generic manufacturer. That compensation can be in the form of cash payments or through a payment associated with some other business transaction (*e.g.*, a cross-licensing agreement) where the branded manufacturer might allegedly “overpay” the generic manufacturer or the generic manufacturer might allegedly “underpay” the branded manufacturer.

The FTC and some antitrust scholars contend that these “reverse payments” are on their face evidence that the settlements are nothing more than a payment by the brand manufacturer to delay generic entry. In this section, we show that such a perspective is flawed because reverse payment settlements can serve to increase or decrease competition and consumer welfare, depending upon the facts and circumstances surrounding the settlement. Thus, a *per se* rule against such settlements would be misguided. Indeed, a view allowing the possibility of reverse payments, with appropriate scrutiny in specific cases (as is available to the FTC under current law), has been adopted by most courts, the DOJ, and many scholars that have addressed this issue.

B. Regulatory and Judicial Enforcement

I. History

The FTC began scrutinizing reverse payment settlements in the late 1990s. Its initial challenges were directed at settlements where the brand-name manufacturer paid cash to the generic manufacturer to settle patent litigation. These challenges resulted in several consent decrees.⁴⁴

The FTC's most prominent challenge was against Schering-Plough ("Schering") and two generic manufacturers relating to Schering's K-Dur (potassium chloride). Schering settled patent litigation with both Upsher-Smith ("Upsher") and ESI Lederle ("ESI") in 1997. The settlement agreement with Upsher included a related licensing agreement where Schering paid Upsher a \$60 million royalty for five Upsher drugs and provided a royalty-free license for Upsher to launch a generic potassium chloride product in 2001 (Schering's patent expired in 2006). The settlement agreement with ESI included a cash payment, as well as a \$15 million royalty payment for two ESI products, and provided a royalty-free license for ESI to launch a generic potassium chloride product in 2004.

The case has a long legal history, in which the disagreements over this issue are on full display. The FTC brought suit against the three companies, alleging that the royalty payments were simply disguised payments to delay generic entry and that the patent settlement agreements were anticompetitive. In 2002, the FTC's Administrative Law Judge ruled that the appropriate legal standard was a "rule of reason" analysis, and that under such an analysis the patent settlement agreements at issue were not anticompetitive.⁴⁵ The FTC appealed this decision to the full Commission, which reversed the decision and concluded that the payments were indeed anticompetitive.⁴⁶ Schering and Upsher then appealed the Commission's opinion to the Eleventh Circuit Court of Appeals. The Eleventh Circuit reversed the Commission's decision, finding that

⁴⁴ FTC Decision and Order, *In the Matter of Abbott Laboratories*, No. C-3945 (May 22, 2000); FTC Decision and Order, *In the Matter of Hoechst, Carderm, and Andrx*, No. 9293 (May 8, 2001). Many of these cases were followed by private suits by direct and indirect purchasers.

⁴⁵ Initial Decision, *In the Matter of Schering-Plough Corp.*, et al, 136 F.T.C. 956, 1092 (2002) (No. 9297).

⁴⁶ Opinion of the Commission, *In the Matter of Schering-Plough Corp. et al*, 136 F.T.C. at 957.

ultimately the determination of competitive effects depends upon the strength of the patent.⁴⁷ The FTC appealed to the Supreme Court, which declined to hear the case.

2. Current status

After these developments, reverse payment settlements are now treated quite differently by the various regulatory agencies and Courts. The FTC has clearly expressed that it views reverse payment settlements as essentially *per se* illegal.⁴⁸ Despite the adverse ruling by the Eleventh Circuit in *Schering*, the FTC has continued to demonstrate an interest in challenging reverse payment settlements.⁴⁹ The DOJ submitted a brief urging the Supreme Court *not* to hear the *Schering* case – a position at odds with the FTC’s view.⁵⁰ Elsewhere, the DOJ has explained that “...settlements between an ANDA filer and the patent holder [even those with a reverse payment] also can benefit consumer welfare. Accordingly, the Department of Justice does not believe *per se* liability under the antitrust laws is the appropriate standard.”⁵¹

Courts that have evaluated these reverse payment settlements have also reached varying conclusions. In the *Cardizem* case, the Sixth Circuit embraced a standard of *per se* illegality.⁵² In stark contrast, the other three circuit courts to address this issue have given reverse payment settlements significant latitude. In both the *Schering* (described above) and *Valley Drug* cases, the Eleventh Circuit relied on a standard that acknowledges the potentially procompetitive nature of these settlements and would give significant latitude as long as the branded patent litigation was not objectively baseless.⁵³

⁴⁷ *Schering-Plough Corp. v. FTC*, 402 F.3d 1056 (11th Cir. 2005).

⁴⁸ See, for example, Opinion of the Commission, *In the Matter of Schering-Plough Corp. et al*, 136 F.T.C. at 957, prohibiting settlements “under which the generic receives ‘anything of value’” (carving out an exception for payments up to \$2 million linked to litigation costs).

⁴⁹ See, e.g., Oral Statement of FTC Commissioner Jon Leibowitz, Hearing of the House Subcommittee on Commerce, Trade, and Consumer Protection, Committee on Energy and Commerce, May 2, 2007.

⁵⁰ On Petition For A Writ Of Certiorari To The United States Court Of Appeals For The Eleventh Circuit, Brief For The United States As Amicus Curiae, *FTC v. Schering-Plough Corp. et al*, 548 U.S. 919 (2006) (No. 05-273).

⁵¹ U.S. Department of Justice, Office of the Assistant Attorney General, Letter to the Honorable Jon Kyl, February 12, 2008.

⁵² *Louisiana Wholesale Drug Co. v. Hoechst Marion Roussel, Inc.* (In re Cardizem CD Antitrust Litig.), 332 F.3d 896 (6th Cir. Mich. 2003).

⁵³ The *Valley Drug* case involved an “interim settlement” of a patent suit between Abbott and Geneva over generic Hytrin. See *Valley Drug Co. v. Geneva Pharms.*, 344 F.3d 1294 (11th Cir. Fla. 2003). Whereas the focus of our paper is on final settlements – where the settlement resolved the litigation – in an interim

Similarly, the Second Circuit applied a rule of reason standard in the *Tamoxifen* case when affirming the trial court opinion that the settlements were not anticompetitive.⁵⁴

Recently, the Federal Circuit applied a similar standard in the *Cipro* case.⁵⁵ In 1991, Bayer entered into an agreement with generic manufacturers Barr Labs, Hoechst Marion Roussel, and The Rugby Group settling patent litigation over Cipro. Under the settlement agreement, Barr certified that it would not market its generic version prior to the expiration of Bayer's patent. Bayer paid Barr a lump sum payment and agreed to either supply Barr with Cipro for resale, or make payments to Barr through December 2003. Consistent with the decisions by the Second and Eleventh Circuits, the Federal Circuit concluded that a rule of reason approach was appropriate and that "[t]he essence of the inquiry is whether the agreements restrict competition beyond the exclusionary zone of the patent." The appellate court affirmed the trial court's conclusion after a similar inquiry, that the plaintiffs had not shown that the agreement was anticompetitive.

C. "Reverse Payment" and "Exclusion Payments" Are Misnomers

Before presenting our economic analysis of reverse payment settlements, it is useful to examine the "reverse payment" moniker itself. Such settlements were baptized by commentators who believe that a payment from the branded manufacturer to the generic manufacturer flows the "wrong" way. In a typical settlement of a patent lawsuit, this argument points out, the alleged infringer pays the patent holder (a lump-sum payment and/or a license fee), while in a reverse payment settlement the patent holder (branded manufacturer) pays the alleged infringer (generic manufacturer).

But this label is based on flawed logic. Hatch-Waxman creates an unusual circumstance in the pharmaceutical industry where the patent holder (branded

or "partial" settlement, the litigation continues but the generic manufacturer agrees not to launch "at risk" while the litigation is ongoing. For a more complete discussion of the competitive implications of interim settlements, see Langenfeld, James and Li, Wenqing, "Intellectual Property and Agreements to Settle Patent Disputes: The Case of Settlement Agreements with Payments from Branded to Generic Drug Manufacturers," *Antitrust Law Journal*, 70, 2003, pp. 777-818.

⁵⁴ *In Re: Tamoxifen Citrate Antitrust Litigation*, 29 F.3d 370 (2d Cir. 2005).

⁵⁵ *In Re: Ciproflaxin Hydrochloride Antitrust Litigation* (Fed Cir. 2008).

manufacturer) can sue the alleged infringer (generic manufacturer) before the alleged infringer markets a product.⁵⁶

In the typical patent case – indeed, in any patent case – the alleged infringer is going to require some compensation for abandoning the litigation.⁵⁷ In a typical case where the patent infringer has been on the market for a significant period of time and would owe significant damages if found liable, the parties may agree to a settlement where the infringer pays damages to the patent holder, but those damages are far less than the damages the patent holder is seeking. In this case, the patent holder pays the infringer to settle the lawsuit by accepting lower damages – this payment is just obscured by the fact that on net some cash flows from the infringer to the patent holder. Reverse payment settlements can be thought of in the same way, but the Hatch-Waxman framework means the patent holder typically does not incur any damages from sales of the infringing products, and so the net payment flows from the branded manufacturer to the generic manufacturer. Since nothing nefarious can be gleaned from the simple fact that the payment flows in a particular direction, one must examine the underlying economics of these settlement agreements.

Similarly, the term “exclusion payments” does not accurately reflect the nature of many of these deals. If the branded manufacturer holds an ultimately valid patent, and the parties settlement allows the generic manufacturer to enter the market prior to patent expiration (but after the generic manufacturer preferred to enter), then the generic was not “excluded” in any meaningful way. The patent itself provided the ability to exclude, not the payment.

D. Basic Economic Model

The framework presented above for an analysis of patent settlements can be used to evaluate reverse payment settlements as well. We start with the highly simplified case

⁵⁶ Generic manufacturers can “enter at risk” – that is enter before final judgment in the patent litigation – but this is the exception rather than the rule. For example, Mr. Downey testified that Barr never enters at risk (Testimony of Bruce Downey, p. 24).

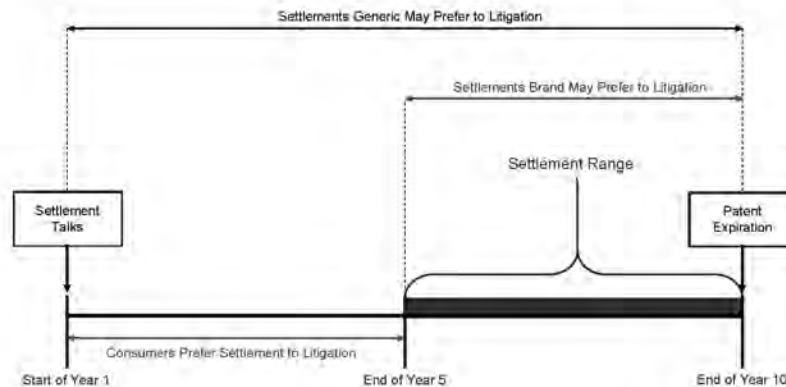

⁵⁷ Crane, Daniel A., “Correspondence: Ease Over Accuracy in Assessing Patent Settlements,” *Minnesota Law Review*, 88, 2004, pp. 698-711; Schildkraut, Marc G., “Patent-Splitting Settlements and the Reverse Payment Fallacy,” *Antitrust Law Journal*, 71(3), 2004, pp. 1033-1068.

outlined in Figure 1 – no litigation costs, full information, and risk neutrality – and relax only the assumption requiring the only term of settlement to be the date of generic entry and allow settlements to include cash payments. How will this affect the range of settlements?

Monopoly profits (profits when only the brand is in the market), will typically be larger than profits when the brand and the generic are both in the market. Of course, branded pharmaceuticals are not necessarily monopolies before the entry of generics, because patents give only a limited right to exclude identical competition and because they may compete with other branded or generic manufacturers. Nonetheless, thinking about analogy to monopoly profits can provide intuition as to why the parties may have an incentive to agree to delay generic entry. A year of delay will be worth more to the branded manufacturer (because it gains a year of “monopoly” profits) than it costs the generic manufacturer (because it loses a year of contested profits), so there will be settlements that delay entry beyond Year 5 that both parties prefer to litigation. As shown in Figure 5, this expands the range of settlements that the brand and generic manufacturers could potentially agree to, but only to include generic entry dates later than Year 5. Consumers will be clearly worse off under these settlements. Of course, without knowing the precise strength of the patent, observed terms of a particular settlement agreement could be consistent with delayed generic entry, as shown in Figure 5, or with a procompetitive settlement where generic entry occurs sooner than would be expected with litigation.

Thus, a model that ignores real-world complexities can lead to the conclusion that a settlement with cash payments from the brand to the generic can harm consumers. In the next section, we extend the basic model – as we did in the earlier section – to account for the additional complexities that drive real-world settlements. This analysis demonstrates that relying on the overly simplistic framework discussed above can frequently lead one to draw incorrect conclusions as to the competitive effects of a patent settlement.

Figure 5
Settlement with Generic Entry Date and Cash Payment

E. Introducing Real-World Complexities to the Basic Model⁵⁸

1. Overview

Expanding the model to account for other real-world factors demonstrates that settlements with reverse payments can be procompetitive. In fact, under certain conditions, without the bargaining tool of a payment from the branded manufacturer to the generic manufacturer, the parties will be unable to reach agreement on a settlement—even if that settlement would benefit consumers.

Many economists that have written on this subject agree that when real-world complexities are taken into account, reverse payment settlements can be procompetitive.

⁵⁸ This section draws on the work of Robert Willig and John Bigelow. See Willig, Robert D. and Bigelow, John P., "Antitrust Policy Toward Agreements that Settle Patent Litigation," *The Antitrust Bulletin*, pp. 655-698, (Fall 2004); Bigelow, John P. and Willig, Robert D., "Reverse Payments in Settlements of Patent Litigation: Schering Plough, K-Dur and the FTC," *The Antitrust Revolution: Economics, Competition, and Policy*, 5th Edition (2008) ("Bigelow and Willig (2008)").

Shapiro (2003) explained:

This is not to say that such payments are necessarily anticompetitive if other factors are brought into the analysis, such as risk aversion and asymmetric information about market conditions, as 'reverse cash payments' may be important in more complex settings for successful settlement.⁵⁹

Bigelow and Willig (2009) share a similar view:

It also follows from economic logic that the opportunity to employ reverse payments may be necessary for socially beneficial and procompetitive settlements to be reached, due to such common situations as asymmetric information, excess optimism, and differential cash needs between the parties to the patent dispute.⁶⁰

Executives in the pharmaceutical industry have expressed similar views. For example, Bruce Downey, the CEO of generic manufacturer Barr Pharmaceuticals, testified to Congress that if a law were passed prohibiting reverse payments "there would be very, very few settlements."⁶¹

2. Cash payments with litigation costs and/or risk aversion

As described above, litigation costs and risk aversion can be important real-world factors to consider in evaluating patent settlements. Accounting for litigation costs and/or risk aversion expands the range of settlement agreements that each party is willing to accept. As shown in Figure 6, these factors expand the range of potential settlements that branded manufacturers will accept (relative to Figure 5), and by creating incentives for branded manufacturers to settle on terms more favorable to consumers it becomes clear that settlements with reverse payments can be procompetitive.

Figure 6
Settlement with Generic Entry Date and Cash Payment
Litigation Costs

3. Cash payments with a cash-strapped generic

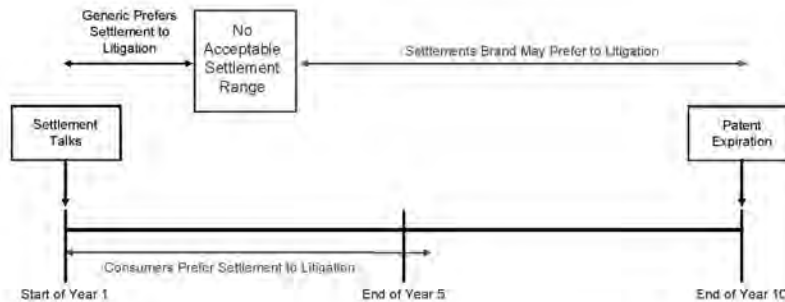

Some observers have argued that, while reverse payment settlements can leave consumers better off than continued litigation, there is always a feasible alternative settlement without a payment (where the parties simply agree on an entry date) that will leave consumers better off than either litigation or a reverse payment settlement. Under this argument, a prohibition on reverse payment settlements would unambiguously leave consumers better off while still allowing the parties to reap the benefits of settlement. This argument ignores the complexities of settlement negotiations.⁶² In the presence of such complexities, additional flexibility in negotiations may be *essential* to enabling a

⁶² A related argument is that an alternative settlement with a different payment and a different entry date may be better for consumers. However, this argument ignores the fact that antitrust regulators consider the implications to competition of an agreement among competitors (such as a reverse payment settlement) versus a but-for world without the agreement, not against an optimal agreement. See Department of Justice and Federal Trade Commission, "Antitrust Guidelines for Collaborations Among Competitors," April 2000, p. 4, 7, and 10.

pro-consumer settlement between the parties. That is, under these circumstances, without a reverse payment the parties would be unable to reach a settlement at all.

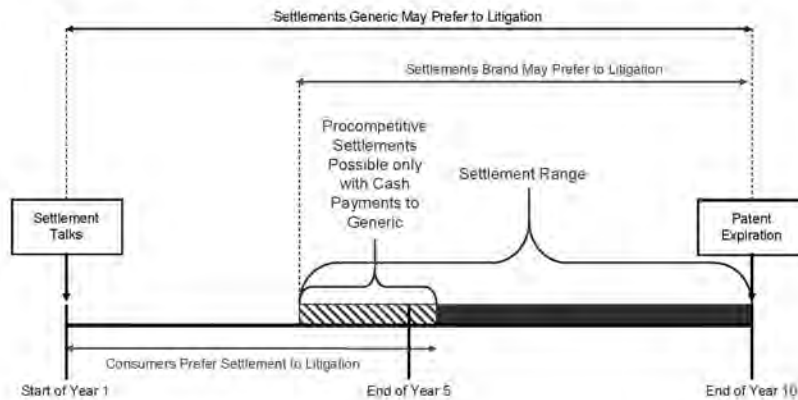

Two real-world complexities ignored by the basic model are the time value of money and the possibility of liquidity constraints. The time value of money refers to the fact that individuals prefer a dollar received today to dollar received in the future; thus they discount the value of future cash flows. Imagine a small, cash-strapped generic entrant that is having a difficult time raising needed capital from the financial markets. As a result, the entrant discounts future profits very heavily, in other words, since it needs cash, it values near-term profits very highly. This generic manufacturer will only accept settlements that allow for relatively early entry, which under the conditions of the example illustrated in Figure 7a would not be acceptable to the branded manufacturer.

Figure 7a
 Settlement with Generic Entry Date and No Cash Payment
 Cash-Strapped Generic and Litigation Costs/Risk Aversion

The latest entry date to which the cash-strapped generic would be willing to agree is earlier than the earliest date to which the branded manufacturer would be willing to agree. As a result, settlement talks would break down.

Figure 7b
 Settlement with Generic Entry Date and Cash Payment
 Cash-Strapped Generic and Litigation Costs/Risk Aversion

A cash payment by the branded manufacturer may allow the branded and generic manufacturers to bridge the settlement gap shown in Figure 7a. The branded manufacturer would be willing to include a cash payment in the settlement in exchange for a later generic entry date. The generic manufacturer would be willing to accept later entry in exchange for a cash payment. As described above, the incremental profits that a branded manufacturer would receive because of postponed generic entry would be higher than the incremental profits that the generic manufacturer would lose from delaying its entry to a more competitive market. Thus, a given cash payment will move the range of entry dates that the branded manufacturer is willing to accept later in time, but it will move the dates the generic is willing to accept by an even greater amount. Such a payment will bring the parties closer together and could bridge the settlement gap between the two parties. As shown in Figure 7b, under these circumstances, reverse payments can lead to a range of settlements that would not have been otherwise feasible.

Importantly, many of these newly conceivable settlements would benefit consumers by resulting in a generic entry date earlier than that expected with continued litigation.

4. Cash payments with an optimistic generic

Cash payments can also help bridge settlement gaps arising under other circumstances. For example, imagine a generic manufacturer that, despite actual odds of winning the patent suit of only 50 percent, believes that it in fact has a 75 percent chance of winning. This mismatch of beliefs and actual probabilities could create a situation similar to that depicted in 7a, where (absent a reverse payment) the generic manufacturer would not be willing to accept any settlement terms the branded manufacturer would be willing to offer because the generic manufacturer has an unrealistic belief about its chance of winning if it holds out and continues to litigate. Just as with a cash-strapped generic, a reverse payment can potentially bridge the settlement gap and lead to a settlement that benefits consumers. Of course, it is possible that the branded manufacturer is also overly optimistic about its odds of success in the litigation, which would reduce the range of procompetitive settlements that a cash payment could generate. Our point here is not that these are the only scenarios that could play out, but rather that there are reasonable scenarios under which a patent settlement with a reverse payment can benefit consumers.

5. Cash payments with information asymmetries

The sets of information known by the brand and the generic manufacturer almost certainly differ significantly, and often in important ways. Willig and Bigelow (2004) describe how this information asymmetry can create another circumstance where cash payments can facilitate a procompetitive settlement agreement that would not otherwise be feasible.

Imagine that the branded manufacturer has private information about the effective life of the patent – for example, about the prospects of future competition from other branded products that would reduce or eliminate demand for the product at issue in the patent litigation. The generic entrant knows that the branded manufacturer is better informed about future competition, and therefore will interpret settlement offers from the branded manufacturer with this in mind.

Suppose there are two types of patents: “high-value” patents, where there is no chance that other branded competitors enter before the patent expires, and “low-value” patents, where there is a decent chance that such brand-name entry happens, significantly reducing the effective life, and the value, of the current patent. The branded manufacturer knows which type of patent it holds, but the generic manufacturer does not.⁶³ In the case of a low-value patent, agreeing to a compromise entry date may have little benefit to the generic because the market may be eliminated by future competition. So a generic may be wary of accepting a reasonable settlement offer because it worries that that settlement may indicate that in fact the patent is low value – and the generic would be better off continuing to litigate.

The problems created by information asymmetries can be overcome if the branded manufacturer is allowed to provide a cash payment to the generic manufacturer. In our example, only branded manufacturers with high-value patents would find it profitable to offer an up-front payment to the generic. Thus, the generic can interpret the reverse payment as a signal that the patent is high value, and have strong reason to believe that the settlement offer is in fact a good offer from a branded manufacturer with a high-value patent, rather than a poor offer from a branded manufacturer with a low-value patent. Here again, cash payments can facilitate settlements – including procompetitive settlements – that would not be reached if such payments were not allowed.

6. Collateral business agreements

Many settlements between branded and generic manufacturers involve collateral business agreements. These agreements may take a variety of forms, including:

- Branded manufacturer licenses products from the generic manufacturer;
- Generic manufacturer licenses products from the branded manufacturer;
- Generic manufacturer agrees to co-promote one or more of the branded manufacturer’s products; and/or

⁶³ Economic models on this point often assume that the branded manufacturer knows the type of patent it holds with certainty. However, the results depend not upon this assumption (as there may be some uncertainty even on the part of the branded manufacturer) but only that the branded manufacturer will have better information on the type of the patent than the generic manufacturer.

- Generic manufacturer agrees to serve as supplier for the branded manufacturer.

Such collateral agreements can be helpful in facilitating settlements by allowing the parties to get around some of the complexities discussed above that may otherwise pose obstacles to successful settlements like information asymmetries and differences in expectations. Unlike cash, the parties' valuations of the components of a collateral business arrangement may be quite different. This difference in valuation could be used to offset different expectations in the patent litigation to arrive at a settlement. In addition, these collateral agreements could in and of themselves benefit consumers, bringing together business partnerships that would not be possible with continued litigation. But while these collateral agreements can serve to facilitate settlements, they could also, in theory, contain "effective" payments that are designed to delay entry of the generic, if the generic manufacturer is over-compensated for what it is providing or the branded manufacturer is under-compensated for what it is providing.

In recent years, patent settlements with collateral business agreements have received significant regulatory and legal scrutiny. For example, as described above, the agreement between Schering and Upsher that was challenged by the FTC did not involve an isolated cash payment to the generic. Rather, in settling the patent dispute, Schering also licensed five different products from Upsher, including Upsher's Niacor SR, in exchange for royalty payments of \$60 million.⁶⁴ The FTC argued that the \$60 million royalty payments were well above the value of the licensed products, and that the payments were just another means to delay generic entry.⁶⁵

Evaluating the competitive implications of settlements with collateral business arrangements is even more complicated than those with cash payments. Such an analysis first requires an evaluation of the collateral business transaction to determine a reasonable assessment of the market value of the transaction. To the extent that it is clear from the evidence that the generic was over-compensated or the brand was under-compensated,

⁶⁴ *Schering-Plough v. FTC*, 402 F.3d, at 1060.

⁶⁵ Ultimately, the Appeals Court concluded that the FTC did not convincingly demonstrate that the \$60 million was not simply a royalty payment within the range of fair market value for the licensed products. See *Schering-Plough v. FTC*, 402 F.3d, at 1068.

then the difference between the payment and the arms-length value of the transaction can be thought of in the same way as a “reverse payment.” Collateral business transactions, just like reverse payments, therefore can be anticompetitive, but they can also serve to produce procompetitive outcomes, some of which may not have been otherwise feasible.

IV. LONG-RUN COMPETITIVE EFFECTS

The discussion to this point has focused on the short-run competitive effects of patent settlements. Clearly, patent settlements can be procompetitive, even when focusing on short-run competition. Patent settlements can also have important long-run competitive effects. First, the scope of patent protection can affect future incentives for branded manufacturers to invest in additional R&D. Patents give patent holders, such as branded pharmaceutical manufacturers, the right to litigate claims against alleged infringers, and the right to settle such litigation – at least as long as such a settlement does not exclude competition beyond that allowed by the patent. Broad-brush limits on the types of patent settlements that are allowed by pharmaceutical manufacturers would likely result in a narrowing of the patent protection currently provided to patent holders. As described above, such patent protection is an important component of pharmaceutical manufacturers’ incentives to invest substantial sums in R&D and to introduce new medications. To the extent that limits on patent settlements reduce incentives to invest in pharmaceutical R&D, consumers may suffer significant adverse effects in the long-run, in the form of a smaller number of new medicines that become available.⁶⁶

Second, the availability of procompetitive settlements can provide further incentives to generic manufacturers to challenge branded patents and bring lower-priced generic drugs to market. Patent litigation can be expensive and risky, particularly for small firms. Restricting the range of settlement options will reduce the ability of generic manufacturers to settle these cases and increase the cost and risk of bringing a generic drug to market. On the margin, this will lower the incentives of generic pharmaceutical

⁶⁶ For a more extensive discussion of these effects, see Langenfeld, James and Li, Wenqing, “Intellectual Property and Agreements to Settle Patent Disputes: The Case of Settlement Agreements with Payments from Branded to Generic Drug Manufacturers,” *Antitrust Law Journal*, 70, 2003, pp. 777-818.

manufacturers to challenge branded patents in the first place.⁶⁷ Even if the effect on a particular generic manufacturer's decision is relatively small, the collective impact on future generic competition can be substantial.

V. POLICY IMPLICATIONS AND CONCLUSIONS

Designing a workable framework that distinguishes procompetitive settlements from anticompetitive settlements is difficult – in part because at its core this depends upon the validity of the patent claims. A settlement agreement whereby the generic manufacturer agrees to enter in, say, five years – but five years before patent expiration – might be anticompetitive if the patent was weak (*i.e.*, if the generic had a high probability of winning at trial). But the same settlement terms might be procompetitive if the patent was strong (*i.e.*, if the generic had a low probability of winning at trial). Ultimately, an evaluation of the competitive effects of a patent settlement cannot avoid at least some investigation into the merits of the patent litigation.

While antitrust economists generally agree with this line of argument, some analysts have suggested prohibiting settlements with “reverse payments.” Several bills have been introduced in Congress that would do just that.⁶⁸

However, as we explain above, under many circumstances, patent settlements between branded and generic manufacturers – even those involving reverse payments – can benefit competition and consumers. An outright prohibition of reverse payment settlements would harm consumer welfare in a range of circumstances. Indeed, prohibiting settlements with cash payments could simply lead to a shift to settlements with other business arrangements which are even more complicated to evaluate, which makes enforcement of potentially anticompetitive arrangements even more difficult to assess. Efforts to prevent settlements with any compensation (whether in the form of cash or compensation from other business arrangements) flowing from the branded

⁶⁷ See, for example, Judge Posner's opinion in *Asahi Glass Co., Ltd. v. Pentech Pharm., Inc.*, 289 F. Supp. 2d 986, 994.

⁶⁸ See, most recently, the Preserve Access to Affordable Generics Act, S.369, 111th Cong. (2009) and the Protecting Consumer Access to Generic Drugs Act of 2009, H.R. 1706, 111th Cong. (2009).

manufacturer to the generic would similarly block many pro-consumer settlements. Of course, an outright prohibition on such settlements would reduce the uncertainty and litigation costs that may follow from antitrust challenges to such settlements. But it is not at all clear that these savings would outweigh the harm created by eliminating potentially procompetitive settlements. “Quick look” or “safe harbor” approaches (whereby settlements with certain characteristics are presumptively anticompetitive or procompetitive, while leaving open the opportunity to rebut this presumption) could reduce these costs while still allowing procompetitive settlements.

Moreover, a restrictive policy approach that sought to bar reverse payment settlements would not only have short-term impacts by preventing procompetitive settlements, but may harm consumers in the long-run by reducing the incentives of branded manufacturers to continue to develop innovative new drugs, and reducing the incentives of generic manufacturers to challenge weak patents and bring generic drugs to market sooner.

Patent settlements between branded and generic pharmaceutical manufactures can be anticompetitive and should continue to be closely scrutinized by the antitrust authorities and the courts. Indeed, current law requires that the terms of any relevant patent settlement agreement be provided to the FTC and the DOJ. But painting all settlements with the same brush is likely to harm consumers. Instead, more individualized treatment is appropriate, whereby the competitive effects of a particular settlement are evaluated by applying an economic framework, such as that presented here, to the facts specific to that settlement.

The views and opinions expressed in this study are solely those of the authors and do not necessarily reflect the views and opinions of PhRMA or any of the organizations with which the authors are or have previously been associated. Compass Lexecon has served as economic consultants to branded and generic manufacturers regarding the competitive effects of patent settlements.

Executive Summary

- Consumers benefit from the availability of innovative new products and from lower prices. In the pharmaceutical industry, both the development of new medicines and price competition from manufacturers of generic drugs provide substantial consumer benefits. Competition policy towards the pharmaceutical industry must therefore represent a balance between protecting incentives for manufacturers of branded drugs to innovate and facilitating entry by manufacturers of lower-priced generic drugs.
- The current framework for patent litigation between branded and generic pharmaceutical manufacturers, established by the Hatch-Waxman Amendments in 1984, is an important component of this balance. Generic manufacturers must notify branded manufacturers before launching a potentially infringing generic product, providing branded manufacturers an opportunity to sue for patent infringement before the generic enters the market. In many cases, litigation is resolved with a settlement between the parties. These settlements may include the following types of provisions:
 - A negotiated date upon which the generic manufacturer will enter the market (with or without royalty payments to the branded manufacturer);
 - Cash payments from the branded manufacturer to the generic;
 - Business transactions between the branded and generic manufacturer such as cross-licensing or supply agreements; and
 - Agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry.
- In recent years, settlements between branded and generic manufacturers have received increased scrutiny from the Federal Trade Commission (FTC) due to concerns that some settlement agreements harm consumers by delaying the entry of lower-priced generic drugs. This paper presents an analytical framework for evaluating the competitive effects of these settlements.
- On the one hand, settlements of litigation – including patent settlements – can provide clear competitive benefits. Litigation imposes substantial costs upon the litigating parties and on society as a whole. Settlements also reduce risk associated with litigation. Because settlements can lower costs and uncertainty, economists agree that settlements can be procompetitive.
- On the other hand, under certain conditions, patent settlements between branded and generic manufacturers can be anticompetitive. Ultimately, the competitive effects of a particular settlement will depend importantly upon the underlying strength of the patent. If the patent is strong, and likely to be found valid and infringed, then even a settlement with an agreed-upon entry date well into the future but before patent expiration may bring generic drugs to market sooner than continued litigation and generate lower prices for consumers. In contrast, if the patent is weak, and likely to be found invalid and/or non-infringed, then even a settlement with an entry date not

far in the future may delay generic entry and harm consumers. Assessing the strength or weakness of a patent in real-world patent litigation is complex – indeed, the precise strength of a patent is subject to the vagaries of the litigation system and is ultimately unknowable even to the parties themselves. Nevertheless, such an assessment is necessary at some level in assessing whether a patent settlement is pro- or anticompetitive.

- While the procompetitive nature of patent settlements is generally recognized by economists, antitrust agencies, and the courts, one category of settlements – so called “reverse payment” settlements – has generated extensive debate in recent years. In these settlements, the parties settle the patent litigation and the branded manufacturer (1) allows the generic manufacturer to enter at or after a particular date in the future (prior to the expiration of the patent) and (2) pays some form of compensation to the generic manufacturer. That compensation can be in the form of cash or through some other business transaction (*e.g.*, a cross-licensing agreement) which provides a conduit through which the branded manufacturer might allegedly “overpay” the generic manufacturer.
- The FTC and some antitrust scholars contend that such “reverse payments” are on their face evidence that the settlements are nothing more than a payment by the brand manufacturer to delay generic entry. They argue that in what one might think of as the “typical” patent settlement case, the defendant (an alleged patent infringer) makes a payment to the plaintiff (the holder of the patent). But in “reverse payment” settlements, they argue that the payment flows the “wrong” way, from the patent holder (branded manufacturer/plaintiff) to the defendant (the generic manufacturer and alleged infringers).
- A “reverse payment” is a misnomer based on flawed logic. In contrast to a “typical” patent case, where the alleged infringer is already selling a product and the patent holder is suing for damages, in patent suits between branded and generic pharmaceutical manufacturers, the generic has typically not entered the market and the branded manufacturer is suing for a remedy akin to injunctive relief. In this case, there is no *a priori* expectation that a payment should flow from the generic manufacturer to the branded manufacturer.
- The use of highly simplified economic models can inappropriately lead to the conclusion that “reverse payment” settlements will always reduce competition. But overly simple economic models ignore important economic realities that can make reverse payment settlements procompetitive. Such realities include, but are not limited to, (a) risk aversion, (b) information asymmetries, (c) differences in expectations, and (d) differences in discount rates. In fact, under certain conditions, without a payment from the branded manufacturer to the generic manufacturer, the parties will be unable to reach agreement on a settlement – even if that settlement would benefit consumers.

- For example, suppose that both the branded and generic manufacturers are overly optimistic about their chances of success in the patent litigation – say the branded manufacturer believes that there is a 75-percent chance that it will win the litigation and the generic manufacturer believes that there is a 75-percent chance that it will win. In this case, the parties will be unable to reach a settlement based upon entry date alone. A reverse payment, however, can facilitate a settlement that is agreeable to both parties and, given the actual chance of success in the patent litigation based on the strength of the underlying patent, provide benefits to consumers relative to continued litigation.
- Other examples of circumstances in which settlement is not possible without compensation between the parties will be discussed in more detail in the report.
- Moreover, competition policy towards patent settlements can have important effects both on the incentives of branded manufacturers to innovate and on the incentives of generic manufacturers to challenge branded patents. Taking some potentially procompetitive settlement options off the table would narrow the patent protection provided to branded manufacturers and, on the margin, lower incentives to invest in new medicines in the future. This would also reduce the ability of generic manufacturers to settle such cases and increase the cost and risk of bringing a generic drug to market. On the margin, this will lower the incentives of generic pharmaceutical manufacturers to challenge branded patents in the first place. Even if the effect on a particular generic manufacturer’s decision is relatively small, the collective impact on future generic competition can be substantial.
- Despite the contention by some that reverse payment settlements should be treated as *per se* illegal, courts, the Department of Justice (DOJ), and many economists have concluded that patent settlements between pharmaceutical manufacturers can be procompetitive and should be given considerable latitude.
 - Decisions by the Second, Eleventh, and most recently the *Cipro* decision by the Federal Circuit Court of Appeals have all concluded that patent settlement agreements between branded and generic pharmaceutical manufacturers – even agreements involving reverse payments – are appropriately treated under a rule of reason standard and are not anticompetitive as long as the agreement is not beyond the exclusionary scope of the patent and the litigation is not objectively baseless.
 - The DOJ has stated that “...settlements between an ANDA filer and the patent holder [even those with a reverse payment] also can benefit consumer welfare. Accordingly, the Department of Justice does not believe *per se* liability under the antitrust laws is the appropriate standard.” Economists have reached similar conclusions.
- Designing a workable framework that distinguishes procompetitive settlements from anticompetitive settlements is difficult – in part because at its core it depends upon

the validity of the patent claims. What is clear is that under many circumstances, patent settlements between branded and generic manufacturers – even those involving reverse payments – can benefit competition and consumers. An outright prohibition of reverse payment settlements would harm consumer welfare in a range of circumstances. Patent settlements between branded and generic pharmaceutical manufactures can be anticompetitive and should continue to be closely scrutinized by the antitrust authorities and the courts. Indeed, current law requires that the terms of any patent settlement agreement between a branded pharmaceutical company and a generic applicant be provided to the FTC and the DOJ. But painting all settlements with the same brush is likely to harm consumers. Instead, more individualized treatment is appropriate, whereby the competitive effects of a particular settlement are evaluated by applying an economic framework, such as that presented here, to the facts specific to that settlement.

I. COMPETITION IN THE PHARMACEUTICAL INDUSTRY

Innovative branded pharmaceutical firms can benefit consumers by developing new drugs. Generic pharmaceutical firms can benefit consumers by offering competition that drives down prices. Thus, the challenge of competition policy in this area (as in all highly innovative industries) is to benefit consumers by striking the appropriate balance between providing sufficient rewards to encourage innovation, followed after a time by a transition to a more competitive market with lower prices.

A. Innovation and Patent Protection

Innovation is the lifeblood of the pharmaceutical industry. In 2007, the pharmaceutical and biotechnology industries invested nearly \$60 billion in research and development ("R&D").⁵ As described by the Congressional Budget Office ("CBO"):

The pharmaceutical industry is one of the most research-intensive industries in the United States. Pharmaceutical firms invest as much as five times more in research and development, relative to their sales, than the average U.S. manufacturing firm.⁶

Since 1990, R&D by pharmaceutical manufacturers has led to the approval of an average of roughly 30 new drugs (molecular entities) and dozens of newly approved formulations or other modifications of existing drugs each year.⁷

Protection of the intellectual property underlying these innovations is critical to providing incentives for pharmaceutical manufacturers to continue to invest in, and develop, new drugs. The research and development process is lengthy, costly, and uncertain. Only a tiny fraction of medicines tested are eventually approved for patient

⁵ Pharmaceutical Research and Manufacturers of America, *Pharmaceutical Industry Profile 2008*, March 2008, pp. 2-3. See also Congressional Budget Office, "Research and Development in the Pharmaceutical Industry," October 2006, pp. 7-9 ("CBO 2006").

⁶ CBO 2006, p. 9.

⁷ U.S. Food and Drug Administration, "CDER NDAs Approved in Calendar Years 1990-2004 by Therapeutic Potential and Chemical Type" (<http://www.fda.gov/cder/rdmt/pstable.htm>); U.S. Food and Drug Administration, "CDER Drug and Biologic Approvals for Calendar Year 2005" (<http://www.fda.gov/cder/rdmt/InternetNDA05.htm>); U.S. Food and Drug Administration, "CDER Drug and Biologic Approvals for Calendar Year 2006" (<http://www.fda.gov/cder/rdmt/InternetNDA06.htm>); U.S. Food and Drug Administration, "CDER Drug and Biologic Approvals for Calendar Year 2007" (<http://www.fda.gov/cder/rdmt/InternetNDA07.htm>).

use,⁸ and only 20 to 30 percent of those approved eventually recoup their R&D investment.⁹ Development of a new drug entails considerable time and expense. These development costs have been rising significantly. Recent studies estimate that the average new drug took 10 to 15 years¹⁰ and cost over \$1.3 billion (including both direct costs and opportunity costs) to develop.¹¹ Strong protection of intellectual property, and the potential rewards that come with it, provide incentives for pharmaceutical companies to undertake such large development costs.

B. Generic Competition

After a branded drug loses patent protection (or a generic manufacturer is able to produce a non-infringing generic version), generic manufacturers often bring bioequivalent versions of branded drugs to market. Numerous economic studies have consistently found that entry of a competing generic manufacturer typically leads to lower average prices, and that this price competition typically intensifies with the entry of additional manufacturers.¹² For example, the CBO concluded in a review of the evidence that:

⁸ For example, one report indicates that only 1 of every 5,000 medicines tested is eventually approved (Tufts Center for the Study of Drug Development. "Backgrounder: How New Drugs Move Throughout the Development and Approval Process," November 1, 2001).

See also CBO 2006, and Adams, Christopher P., and Brantner, Van V. "Estimating the Cost of New Drug Development: Is It Really \$802 Million?" *Health Affairs*, 25(2), 2006, pp. 420-428.

¹² See, for example, Grabowski, Henry G. and Vernon, John M. "Brand Loyalty, Entry and Price Competition in Pharmaceuticals After the 1984 Drug Act," *Journal of Law and Economics*, 35, October 1992, pp. 331-350. Other articles reaching similar findings include: Frank, R. G. and Salkever, D. S. "Pricing, Patent Loss and the Market for Pharmaceuticals," *Southern Economic Journal*, 59(2), 1992, pp. 165-179; Caves, Richard E., Whinston, Michael D., and Hurwitz, Mark A. "Patent Expiration, Entry, and Competition in the U.S. Pharmaceutical Industry," *Brookings Papers on Economic Activity: Microeconomics*, 1991, pp. 1-48; Congressional Budget Office, "How Increased Competition from Generic Drugs Has Affected Prices and Returns in the Pharmaceutical Industry," July 1998, pp. 28-33 ("CBO 1998"). As Grabowski and Vernon (1992) and others have found, branded manufacturers may increase

The dramatic rise in generic sales since 1984 has held down average prices for drugs that are no longer protected by a patent. ...[A]verage prices fall primarily because consumers switch from the higher-priced innovator drug to the lower-priced generics. To be on the receiving end of that switch, generic manufacturers compete with each other intensely in the area of price, partly because they sell identical products. The increased use of generic drugs has kept total spending on prescription drugs below what it might otherwise have been.¹³

As the next section discusses, given the significant consumer benefits that result from both innovation and lower prices, policy-makers have sought to facilitate generic competition within a framework intended to provide branded manufacturers sufficient incentives to innovate.

C. The Hatch-Waxman Amendments

1. Introduction

In 1984, the U.S. Congress passed the Hatch-Waxman Amendments (“Hatch-Waxman”)¹⁴ to the Federal Food, Drug, and Cosmetic Act of 1938, which sought to balance the importance of innovation and generic entry. Hatch-Waxman established the current framework for patent litigation in the pharmaceutical industry, and although this framework has been modified since 1984, it largely remains intact. Any analysis of the economics of patent settlements must begin with an understanding of this framework.

2. FDA approval prior to Hatch-Waxman

Since 1962, the Food and Drug Administration (“FDA”) has required pharmaceutical companies to prove that new branded drugs are “safe and effective” prior to approval. Branded drug manufacturers provide such evidence by conducting costly and lengthy clinical trials. The process of conducting clinical trials and obtaining FDA approval decreases the effective life of pharmaceutical patents substantially, because

their prices in response to generic entry, but the net effect of lower generic prices and higher branded prices is generally to lower average prices for the molecule.

¹³ CBO 1998, p. 13.

¹⁴ More formally, the law was known as the Drug Price Competition and Patent Term Restoration Act of 1984.

approval is typically received many years after a patent is granted.¹⁵ Before Hatch-Waxman, the FDA also required generic manufacturers to conduct their own safety and efficacy studies. Generic manufacturers could not begin their safety and efficacy studies until patents on the brand-name drug had expired.

3. Overview of Hatch-Waxman

The intent of Hatch-Waxman was to alter the FDA approval process in two important ways:

On the one hand, Hatch-Waxman sought to increase patent protection and to strengthen the incentives of branded manufacturers to innovate. Recognizing that the lengthy FDA approval process often substantially reduced the effective life of pharmaceutical patents, Hatch-Waxman allowed branded manufacturers to apply to extend the life of these patents to regain some of the patent life lost by clinical trials and the FDA approval process.¹⁶

On the other hand, Hatch-Waxman attempted to encourage generic competition. It streamlined the approval process for generic manufacturers, thereby reducing the costs of obtaining FDA approval and speeding their time to market. More specifically, Hatch-Waxman allowed generic pharmaceutical companies to submit an Abbreviated New Drug Application (ANDA), simply referencing the safety and efficacy results submitted by the branded company rather than conducting new clinical trials, so long as the generic drug could demonstrate “bioequivalence,” which means that the rate and extent of absorption of the generic drug is not significantly different from that of the brand-name drug when administered with the same dosage. Branded manufacturers were required to file

¹⁵ CBO 1998, p. 39.

¹⁶ Specifically, the branded manufacturer could apply for an extension on one patent equal to half of the time spent on clinical trials plus all of the time spent in FDA review, subject to a maximum extension of five years and a maximum effective patent life of 14 years. See Giabowski, Henry G. and Kyle, Margaret, “Generic Competition and Market Exclusivity Periods in Pharmaceuticals,” *Managerial and Decision Economics* 28, 2007, p. 492. Additionally, regardless of whether a new drug has patent protection, upon approval of an NDA for a New Chemical Entity, a drug will receive a 5-year term of exclusivity from the FDA. During this exclusivity period an ANDA that references the brand manufacturer’s NDA cannot be submitted (except after four years if there is a patent challenge). See: “Frequently Asked Questions on Patents and Exclusivity,” *U.S. Food and Drug Administration*, <http://www.fda.gov/cder/ob/faqs.htm#How>.

information about any relevant patents with the FDA. In addition, the ANDA filer must certify one of the following:

- (1) the required patent information has not been filed by the branded manufacturer
- (2) the patent has expired;
- (3) the patent will expire, identifying the expiration date; or
- (4) the patent is invalid and/or not infringed.

The latter representation is known as a Paragraph IV certification.

Since Hatch-Waxman, competition from generic drugs has grown significantly. The generic share of prescriptions has grown from 19 percent in 1984 to nearly 67 percent today.¹⁷

4. Patent litigation under Hatch-Waxman

Hatch-Waxman established several important aspects of patent litigation between branded and generic manufacturers. First, an ANDA filer who makes a Paragraph IV certification that the existing patent is invalid or not infringed must notify the patent holder (and the branded manufacturer) of the basis for its assertion. Under Hatch-Waxman, if a branded manufacturer files suit within 45 days of receiving notice of a Paragraph IV certification, the branded company is granted an automatic stay of FDA final approval of the generic company's ANDA until the earliest of: (1) 30 months from the notification date; (2) the district court decides the patent is invalid or not infringed; or (3) the patent expires. This is commonly known as a "30-month stay." If the patent holder does not file suit within the 45-day window, then the FDA may approve the ANDA immediately, provided all other requirements are met.

Second, the earliest generic pharmaceutical company to file an ANDA with a Paragraph IV certification for a particular drug is awarded a "180-day exclusivity period," during which time the FDA may not approve any Paragraph IV ANDAs filed

¹⁷ See, for example, Generic Pharmaceutical Association (GPhA), "Annual Report 2008: Generics: The Right Choice for Better Health," 2008, p. 6; GPhA, "Industry History" (available at <http://www.gphaonline.org/Content/NavigationMenu/AboutUS/History.htm>).

subsequently for the same drug.¹⁸ The start of the 180-day exclusivity period is triggered by commercial marketing of the first filer's product.¹⁹ If the first filer does not exercise its exclusivity in a timely fashion, a variety of circumstances can lead to the forfeiture of its eligibility for exclusivity.²⁰ The substantial profits available during the 180-day period of exclusive marketing (in which the exclusive generic can charge a higher price than it could in the face of competition from other generic manufacturers and capture a larger share of sales) provide generic firms with an additional incentive to be first to challenge potentially invalid patents or to invent around the patented technology by developing a non-infringing alternative.

D. Patent Litigation and Settlement Agreements

ANDA filings frequently result in patent litigation. From 1998 to 2000, roughly 20 percent of filed ANDAs contained Paragraph IV certifications, where the generic manufacturer claimed that the branded manufacturer's patent(s) were invalid or not infringed.²¹ A study by the FTC of ANDA filings between 1992 and 2000 found that a Paragraph IV certification resulted in patent litigation nearly 75 percent of the time.²²

In general, the vast majority of patent litigation is resolved through a settlement between the parties.²³ Settlements between branded and generic pharmaceutical manufacturers are common. From 1992 to 2000, nearly 40 percent of litigations against the first ANDA filer resulted in settlement.²⁴ Similarly, Barr, one of the largest generic

¹⁸ Under certain circumstances (e.g., two generic manufacturers file ANDAs containing a Paragraph IV certification for the same branded drug on the same day) the FDA may grant "shared exclusivity" in which both generic manufacturers can receive final approval simultaneously and potentially share the 180-day exclusivity period.

¹⁹ For products subject to the prior law before 2003, the 180 days would also be triggered by a court decision of invalidity or noninfringement of the relevant patent.

²³ See, for example, Shapiro, Carl. "Antitrust Limits to Patent Settlements," *RAND Journal of Economics*, 43(2), 2003, pp. 391-411 ("Shapiro (2003)").

²⁴ FTC 2002, pp. 15-16.

manufacturers, has settled nearly half of the 30 patent cases that it has been involved with (and the vast majority of cases that are not still pending) in the last 15 years.²⁵

These settlements take many forms and can include the following types of provisions:

- An agreed-upon date upon which the generic manufacturer will enter the market (with or without royalty payments to the branded manufacturer);
- Cash payments from the branded manufacturer to the generic;
- Ancillary business transactions such as cross-licensing or supply agreements; and
- Agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry.

Pharmaceutical manufacturers settling patent litigation are required to report information on those settlements to the FTC and DOJ, and the FTC publishes annual reports summarizing those settlements.²⁶ The following table provides a summary of the FTC's classification of settlements that have been entered into over the last several years between branded and generic pharmaceutical manufacturers.²⁷

	Total Settlements	Settlements Allowing Immediate Generic Entry	Settlements Not Allowing Immediate Generic Entry	
			With No Compensation to Generic	With Compensation to the Generic ²⁸
FY 2004	14	9	5	0
FY 2005	11	7	1	3
FY 2006	28	8	6	14
FY 2007	33	8	11	14

²⁵ Testimony of Bruce Downey, "Paying Off Generics to Prevent Competition With Brand Name Drugs: Should It Be Prohibited?" *Hearing Before the Committee on the Judiciary, United States Senate, Serial No. J-110-4, 2007*, p. 23. ("Testimony of Bruce Downey") Specifically, Mr. Downey testified that this has been true during his tenure as CEO, which began in 1993.

²⁶ This requirement was created by the 2003 MMA and effective in FY 2004.

²⁷ Federal Trade Commission, "Summary of Agreements Filed in FY 2004," Figure II; Federal Trade Commission, "Summary of Agreements Filed in FY 2005," p. 3; Federal Trade Commission, "Summary of Agreements Filed in FY 2006," pp. 3-4; Federal Trade Commission, "Summary of Agreements Filed in FY 2007," p. 3 and Figure III.

²⁸ As defined by the FTC, compensation may be in the form of cash, an ancillary business transaction, or an agreement by the branded manufacturer not to launch or license an authorized generic for some period after generic entry. According to the FTC reports, many of these settlements also include compensation to the branded manufacturer - the reports do not provide sufficient information to determine whether there was a net payment to the generic.

II. COMPETITIVE EFFECTS OF PATENT SETTLEMENTS: SHORT-RUN

A. Overview

1. Patent settlements reduce the direct and indirect costs of litigation

Settlements of litigation provide clear potential benefits. After all, litigation imposes substantial costs. Costs to litigating parties include (1) direct litigation costs such as legal fees, (2) indirect costs such as requiring attention of company executives and distracting them from their responsibilities of running the business, and (3) indirect costs due to uncertainty.²⁹ Additional costs to society as a whole include increased congestion of the court system and corporate resources focused on private dispute resolution as opposed to innovation and production activities. Moreover, as firms generally pass on at least some portion of costs incurred, consumers ultimately bear some of these costs.

2. Patent settlements have the potential to be anticompetitive

While patent settlements between branded and generic manufacturers have clear potential benefits, they also can harm competition and consumers under certain conditions. The potential for anticompetitive effects is increased when the settlement is with the first generic filer, rather than a subsequent generic filer, and the first filer does not relinquish its exclusivity. As described above, under Hatch-Waxman, the first generic filer receives 180 days of marketing exclusivity. This creates the potential for anticompetitive effect to the extent that delaying entry by the first filer could delay entry by all other generics as well. Prior to 2003, when much of the concern over patent settlements in the pharmaceutical industry originated, a settlement agreement did not affect 180-day exclusivity. Thus, a settlement with a first filer specifying an entry date well into the future could also prevent other generics from entering before that date (unless a subsequent-filing generic obtained a court decision that its product did not infringe or that the patent was invalid. Recognizing the potential anticompetitive effects of such a situation, a 2003 law introduced additional restrictions on “parking” the 180-

²⁹ See, for example, Shapiro (2003), p. 394; Bessen, James E. and Meurer, Michael J., “The Private Costs of Patent Litigation,” *2nd Annual Conference on Empirical Legal Studies Paper*, February 1, 2008, p. 2.

day exclusivity. Importantly, the law was changed such that if the branded and generic manufacturers reach a settlement agreement, the settlement is challenged by the FTC or DOJ, and the agreement is determined to violate the antitrust laws, then the generic manufacturer forfeits its exclusivity.³⁰ This change substantially lessens the antitrust concerns with such settlements.

Ultimately, the competitive effects of a particular settlement will depend importantly upon the strength of the underlying patent.³¹ A patent gives the branded manufacturer the right, within certain boundaries, to exclude competition.³² If the patent is quite strong, and likely to be found valid and infringed, then even a settlement with an agreed-upon entry date well into the future but before patent expiration may bring generic drugs to market sooner than the expected outcome from continued litigation and generate lower prices for consumers. Moreover, there are frequently several generic manufacturers challenging a brand-name patent at any given time. Where this is the case, a settlement agreement with the first-filing generic has even less potential for anticompetitive effect where the brand-name patent is weak. While the incentive may not be as strong as that of the first filer (due to the 180-day exclusivity), other generic manufacturers continue to have an incentive to continue their challenge of patents they believe are invalid or that they do not infringe.³³

In contrast, if the patent is quite weak, and likely to be found invalid and/or non-infringed, then even a settlement with an entry date not far in the future may delay generic entry and harm consumers. Considering the strength of a patent in real-world patent litigation, at least to some extent, is complex, but necessary. The next section presents an economic framework for this evaluation.

³⁰ 2003 MMA.

³¹ Some courts have considered not the subjective assessments of the parties but what a "reasonable person" would think. See, e.g., *Asahi Glass Co., Ltd. v. Pentech Pharm., Inc.*, 289 F. Supp. 2d 986, 992-993.

³² See Shapiro (2003) for a discussion of patents as probabilistic property rights.

³³ The 180-day exclusivity provides a motivation for generic manufacturers to bear the cost and risk associated with developing generic versions of branded drugs and challenging branded patents. But at the time of a settlement with the first-filing generic, many subsequent generic entrants may have already incurred many of these costs. Thus, even relatively small profits expected by a subsequent filer could provide the incentive to continue to challenge the branded patent.

B. Economic Framework

1. Basic Model

Determining the scope of patent settlements that could raise antitrust concerns amounts to evaluating the following question: Which settlements would be in the economic interest of both the branded and generic manufacturer, but would harm consumers, relative to continuing litigation? Answering this question requires modeling the settlement decisions of both the branded and generic manufacturers, as well as evaluating the benefit to consumers from generic entry.

The standard economic model of settlements compares each settling party's economic gains from settling to its economic gains from continuing the litigation.³⁴ One then compares these two sets of settlement terms to determine the range of settlement terms that both parties would find preferable to continued litigation – in other words, those settlement terms that would feasibly lead to the end of the litigation.

Once the range of feasible settlements is established, one needs to determine which of these settlements, if any, would benefit consumers.³⁵ After all, consumers are not a party to the settlements, and so one might imagine that there could be settlements which benefit branded and generic manufacturer that do not benefit consumers.

For expositional purposes, we start with a highly simplified model of a patent settlement between branded and generic manufacturer. Assume:

- The parties are considering settlement at the beginning of Year 1
- The patent expires at the end of Year 10
- The generic manufacturer both believes that it has and in fact has a 50 percent chance of winning the patent case (and the branded manufacturer also has, and perceives, a 50 percent chance)
- There are no costs to litigation

³⁴ For a general discussion of the settlement decision, see Cooter, Robert and Rubinfeld, Daniel L., "Economic Analysis of Legal Disputes and their Resolution," *Journal of Economic Literature*, September 1989, pp. 1067-1097.

³⁵ In this paper, the term "consumers" is used to represent those that ultimately pay for prescription drugs. In reality, this is a combination of patients, private insurers, and government.

- The only settlement tool available is the date of generic entry (*i.e.*, lump sum payments, royalty payments, and other business transactions are not allowed).³⁶

As we describe below, many of these assumptions do not affect the conclusions, but rather allow for an easier grasp of the intuition underlying the economic model. Other assumptions will have important effects on the conclusions. In the sections that follow, we will introduce real-world complexities and examine the implications of enriching the model.

Under these original assumptions, the expected or average outcome from litigation is generic entry at the end of Year 5. There is a 50 percent chance of immediate entry if the generic wins and a 50 percent chance of entry at the end of Year 10 if the brand wins. The settlement decision amounts to a comparison of the profits from settling to a simple average of the profits assuming immediate generic entry (50 percent chance the generic wins) and the profits assuming generic entry in Year 10 (50 percent chance the generic loses). Under the assumptions provided above, the simple average of profits from litigation is equivalent to the profits from entry at the end of Year 5.

In this simple framework, the only tool the parties can use in settlement negotiations is the date of entry of the generic. As shown in Figure 1, the branded manufacturer would agree to a settlement with generic entry at any point after the end of Year 5, whereas the generic manufacturer would agree to a settlement with generic entry at any point up until the end of Year 5. Thus, no settlement can be mutually agreeable to the two parties. The settlement ranges of the two parties are contiguous, but do not overlap.

Of course, this simple model assumes away many complexities present in the real world – indeed, some of the very complexities that provide important incentives for litigating parties to settle. In the next section, we relax some of these assumptions and

³⁶ Other assumptions include: (1) Total prescriptions are constant in each year, as is the share of prescriptions by the branded and generic manufacturers after generic entry. (2) There is perfect information, so both parties know the ultimate chance of winning. (3) Both parties are risk neutral. (4) There is no time value of money for either party. (5) After entry, there will be only one generic competitor.

demonstrate that doing so leads to a range of reasonable conditions under which patent settlements can benefit consumers.

Figure 1
Settlement with Generic Entry Date

Note: There are no settlements that both the Brand and Generic prefer to Litigation

2. Litigation costs

A primary motivation for parties to settle litigation is that it is costly. The oversimplified model presented above ignores this motivation. We now introduce litigation costs into the model and show that it leads to a range of settlements that would be agreeable to both the branded and generic manufacturers and could also make consumers better off.

Figure 2 shows that, because litigation is costly, the brand-name manufacturer would be willing to accept settlements where the generic enters before the end of Year 5 (*i.e.*, earlier than it would be willing to accept based only on the profits from winning or losing the litigation), because the brand-name manufacturer would avoid these costs. Similarly, the generic would be willing to accept settlements which would have it entering after the end of Year 5 (*i.e.*, later than it would be willing to accept based only on the chance of winning or losing the litigation). These litigation costs enlarge the range

of settlements that would be agreeable to both parties.³⁷ In this way, litigation costs create the possibility of some settlements – those that would lead the generic to enter before the end of Year 5 – that would benefit consumers. Accounting for the fact that part of litigation costs are ultimately borne by consumers broadens the range of procompetitive settlements.

Figure 2
Settlement with Generic Entry Date
Litigation Costs

Of course, the particular size of settlement ranges shown in these figures is not meant to convey the relative likelihood of any particular type of settlement, but simply to demonstrate the economic logic that certain kinds of settlements exist. Indeed, what seems to be a clear distinction between procompetitive and anticompetitive in these diagrams is in fact quite difficult to distinguish in the real world. Recall that our example

³⁷ Because annual profits for the generic are lower than annual pro-generic entry profits for the branded manufacturer, the generic would be willing to give up more time in the market to avoid those costs, assuming litigation costs for the brand and the generic are similar.

assumes a 50 percent chance that the generic manufacturer will win the patent litigation – and that everyone knows that probability. But the precise strength of the patent is not knowable to the antitrust analyst or even the parties themselves. It will depend on a wide range of factors that affect the outcome of litigation, including the documentary evidence, the quality of presentations by counsel, the testimony of company witnesses, the testimony of expert witnesses, and the particular judge and jury assigned to the case. Whereas settlements with entry after Year 5 could harm consumers under the assumptions we have presented, such settlements could in fact be procompetitive if the generic manufacturer's chance of winning the patent litigation was only, say, 30 percent.

3. *Risk aversion*

Another cost of litigation is the substantial uncertainty that it creates. Economists model the cost of uncertainty using the concepts of “risk aversion” and “risk premiums.”³⁸ For example, a risk-averse economic actor will prefer to receive \$2 with certainty, rather than a 50 percent chance at \$1 and a 50 percent chance at \$3. That is, risk-averse individuals prefer a certain outcome to uncertain outcomes with the same average or expected value but some degree of variance. A risk premium is the amount of money that a party would pay to avoid taking a risk. In the example above, the risk premium is the amount the individual would pay in order to receive the \$2 with certainty rather than the option with 50-50 odds. The concept of a risk premium allows us to model uncertainty in the same way we do other litigation costs – where the risk premium is the additional cost to the parties created by the uncertainty. Thus, just as in the discussion of litigation costs above, both branded and generic manufacturers would accept lower expected profits under a settlement relative to continued litigation to avoid heightened uncertainty. As shown in Figure 3, the effects are similar to those with litigation costs.³⁹

³⁸ See Pindyck, Robert and Rubinfeld, Daniel. *Microeconomics*, 5th Edition, 2001, Section 5.2.

³⁹ Similarly, if consumers are risk averse, accounting for this would broaden the range of procompetitive settlements.

Figure 3
Settlement with Generic Entry Date
Risk Aversion and Litigation Costs

Is it reasonable to assume that large pharmaceutical companies are risk averse? After all, a basic tenet of financial economics holds that a large firm and/or a firm owned by (and effectively managed for) well-diversified shareholders should be risk neutral. The risk from a particular litigation can be effectively eliminated through diversification—in this case, by investing in many projects or holding many stocks. However, this argument ignores two important realities. First, it ignores the so-called principal-agent problem that can exist between the managers of the firm (in this case, the executives with decision-making power over the decision to settle or continue litigating) and the shareholders of the firm.⁴⁰ While the firm's shareholders may be risk neutral, because they can diversify their risks over many investments, managers whose jobs and salaries depend to some extent on their current employer may be risk averse, instead. Second, not all pharmaceutical companies – not even all branded manufacturers – are large firms

⁴⁰ For a general discussion of the principal-agent problem see, for example, Rubinfeld, Daniel L. and Robert S. Pindyck, *Microeconomics*, 5th Edition, 2001, pp. 609-613.

owned by diversified shareholders. For some branded manufacturers, the financial health of the company may depend importantly on the success of a single drug line.

4. Information asymmetries

Information asymmetries are another important component of settlement decisions. Both the branded and the generic manufacturer are likely to have information that the other party does not possess. The generic manufacturer, for example, may have better information about its ability to manufacture a generic version of the branded product. For example, a generic manufacturer may have manufacturing problems that delay its entry beyond the point at which it receives FDA approval (or that make such entry less effective). The branded manufacturer would be unlikely to know of such problems at the time of the settlement discussions.

The branded manufacturer, on the other hand, may have better information about the expected size of the market for the product in the future. Branded pharmaceuticals generally have a limited life cycle; a branded drug often faces increasing competition from newer and often more effective branded products. The branded manufacturer may, for example, have specific knowledge of a next-generation product in its development pipeline which could substantially reduce the potential market for the litigated drug in the future.

These are just two examples of information asymmetries; there are many dimensions on which such asymmetries can exist. The parties may have private information that alters their probabilities of winning the patent litigation, about the competitive strategies (*e.g.*, pricing) they plan to employ after generic entry, or other factors.

We now introduce a specific example of information asymmetry to our model. Assume that the generic manufacturer knows that, even if it wins the patent litigation, manufacturing issues will prevent it from launching until the beginning of Year 3 (two years from now). Assume also that the branded manufacturer is unaware of this.

Figure 4
Settlement with Generic Entry Date
Information Asymmetry and Litigation Costs

In this case, as shown in Figure 4, the generic manufacturer would be willing to agree to a settlement with entry as late as Year 6 (even later factoring in litigation costs), which would give it an additional four years of generic profits relative to the scenario when it litigates and loses. This outcome splits the difference between the eight years of additional profits (Year 3 through Year 10) it would receive if it won the litigation, and the zero years if it lost. Similarly, consumers would be better off under a settlement with a date up to and including Year 6. The branded manufacturer, unaware that the generic has any production issues, has the same preferences it did in the initial example: It would agree to any settlement with generic entry as early as Year 5. Thus, as shown in Figure 4, procompetitive settlements with an entry date between Year 5 and Year 6 are feasible (and adding litigation costs or risk aversion to the model would only expand the range of procompetitive settlements).

Litigation costs, risk aversion, and information asymmetries are only three of the potential real-world complexities that can give rise to procompetitive patent settlements

between the branded and generic manufacturer. For example, the preceding section has assumed that both parties have identical expectations as to the outcome of the litigation. It is highly likely, however, that the parties' expectations will differ at least to some extent – and perhaps greatly – and these differences can have important effects on the ability of the parties to reach settlement and the effects of those settlements on consumers. In the next section, we explore these and other issues in the specific context of reverse payment settlements.

III. COMPETITIVE EFFECTS OF REVERSE PAYMENT SETTLEMENTS: SHORT-RUN

A. Overview

While the possibility of the procompetitive nature of patent settlements is generally recognized by economists, antitrust agencies, and the courts, one category of settlements – so-called “reverse payment” settlements – has generated extensive debate in recent years. In these settlements, the parties settle the patent litigation and the branded manufacturer (1) allows the generic manufacturer to enter at or after a particular date in the future (prior to the expiration of the patent) and (2) pays some form of compensation to the generic manufacturer. That compensation can be in the form of cash payments or through a payment associated with some other business transaction (e.g., a cross-licensing agreement) where the branded manufacturer might allegedly “overpay” the generic manufacturer or the generic manufacturer might allegedly “underpay” the branded manufacturer.

The FTC and some antitrust scholars contend that these “reverse payments” are on their face evidence that the settlements are nothing more than a payment by the brand manufacturer to delay generic entry. In this section, we show that such a perspective is flawed because reverse payment settlements can serve to increase or decrease competition and consumer welfare, depending upon the facts and circumstances surrounding the settlement. Thus, a *per se* rule against such settlements would be misguided. Indeed, a view allowing the possibility of reverse payments, with appropriate scrutiny in specific cases (as is available to the FTC under current law), has been adopted by most courts, the DOJ, and many scholars that have addressed this issue.

B. Regulatory and Judicial Enforcement

1. History

The FTC began scrutinizing reverse payment settlements in the late 1990s. Its initial challenges were directed at settlements where the brand-name manufacturer paid cash to the generic manufacturer to settle patent litigation. These challenges resulted in several consent decrees.⁴¹

The FTC's most prominent challenge was against Schering-Plough ("Schering") and two generic manufacturers relating to Schering's K-Dur (potassium chloride). Schering settled patent litigation with both Upsher-Smith ("Upsher") and ESI Lederle ("ESI") in 1997. The settlement agreement with Upsher included a related licensing agreement where Schering paid Upsher a \$60 million royalty for five Upsher drugs and provided a royalty-free license for Upsher to launch a generic potassium chloride product in 2001 (Schering's patent expired in 2006). The settlement agreement with ESI included a cash payment, as well as a \$15 million royalty payment for two ESI products, and provided a royalty-free license for ESI to launch a generic potassium chloride product in 2004.

The case has a long legal history, in which the disagreements over this issue are on full display. The FTC brought suit against the three companies, alleging that the royalty payments were simply disguised payments to delay generic entry and that the patent settlement agreements were anticompetitive. In 2002, the FTC's Administrative Law Judge ruled that the appropriate legal standard was a "rule of reason" analysis, and that under such an analysis the patent settlement agreements at issue were not anticompetitive.⁴² The FTC appealed this decision to the full Commission, which reversed the decision and concluded that the payments were indeed anticompetitive.⁴³ Schering and Upsher then appealed the Commission's opinion to the Eleventh Circuit Court of Appeals. The Eleventh Circuit reversed the Commission's decision, finding that

⁴¹ FTC Decision and Order, *In the Matter of Abbott Laboratories*, No. C-3945 (May 22, 2000); FTC Decision and Order, *In the Matter of Hoechst, Carverm, and Andrx*, No. 9293 (May 8, 2001). Many of these cases were followed by private suits by direct and indirect purchasers.

⁴² Initial Decision, *In the Matter of Schering-Plough Corp.*, et al. 136 F.T.C. 956, 1092 (2002) (No. 9297).

⁴³ Opinion of the Commission, *In the Matter of Schering-Plough Corp.*, et al. 136 F.T.C. at 957.

ultimately the determination of competitive effects depends upon the strength of the patent.⁴⁴ The FTC appealed to the Supreme Court, which declined to hear the case.

2. Current status

After these developments, reverse payment settlements are now treated quite differently by the various regulatory agencies and Courts. The FTC has clearly expressed that it views reverse payment settlements as essentially *per se* illegal.⁴⁵ Despite the adverse ruling by the Eleventh Circuit in *Schering*, the FTC has continued to demonstrate an interest in challenging reverse payment settlements.⁴⁶ The DOJ submitted a brief urging the Supreme Court *not* to hear the *Schering* case – a position at odds with the FTC’s view.⁴⁷ Elsewhere, the DOJ has explained that “...settlements between an ANDA filer and the patent holder [even those with a reverse payment] also can benefit consumer welfare. Accordingly, the Department of Justice does not believe *per se* liability under the antitrust laws is the appropriate standard.”⁴⁸

Courts that have evaluated these reverse payment settlements have also reached varying conclusions. In the *Cardizem* case, the Sixth Circuit embraced a standard of *per se* illegality.⁴⁹ In stark contrast, the other three circuit courts to address this issue have given reverse payment settlements significant latitude. In both the *Schering* (described above) and *Valley Drug* cases, the Eleventh Circuit relied on a standard that acknowledges the potentially procompetitive nature of these settlements and would give significant latitude as long as the branded patent litigation was not objectively baseless.⁵⁰

⁴⁴ *Schering-Plough Corp. v. FTC*, 402 F.3d 1056 (11th Cir. 2005).

⁴⁵ See, for example, Opinion of the Commission, *In the Matter of Schering-Plough Corp. et al*, 136 F.T.C. at 957, prohibiting settlements “under which the generic receives ‘anything of value’” (carving out an exception for payments up to \$2 million linked to litigation costs).

⁴⁶ See, e.g., Oral Statement of FTC Commissioner Jon Leibowitz, Hearing of the House Subcommittee on Commerce, Trade, and Consumer Protection, Committee on Energy and Commerce, May 2, 2007.

⁴⁷ On Petition For A Writ Of Certiorari To The United States Court Of Appeals For The Eleventh Circuit, Brief For The United States As Amicus Curiae, *FTC v. Schering-Plough Corp. et al*, 548 U.S. 919 (2006) (No. 05-273).

⁴⁸ U.S. Department of Justice, Office of the Assistant Attorney General, Letter to the Honorable Jon Kyl, February 12, 2008.

⁴⁹ *Louisiana Wholesale Drug Co. v. Hoechst Marion Roussel, Inc.* (In re Cardizem CD Antitrust Litig.), 332 F.3d 896 (6th Cir. Mich. 2003).

⁵⁰ The *Valley Drug* case involved an “interim settlement” of a patent suit between Abbott and Geneva over generic Ilytrin. See *Valley Drug Co. v. Geneva Pharms.*, 344 F.3d 1294 (11th Cir. Fla. 2003). Whereas the focus of our paper is on final settlements – where the settlement resolved the litigation – in an interim

Similarly, the Second Circuit applied a rule of reason standard in the *Tamoxifen* case when affirming the trial court opinion that the settlements were not anticompetitive.⁵¹

Recently, the Federal Circuit applied a similar standard in the *Cipro* case.⁵² In 1991, Bayer entered into an agreement with generic manufacturers Barr Labs, Hoechst Marion Roussel, and The Rugby Group settling patent litigation over Cipro. Under the settlement agreement, Barr certified that it would not market its generic version prior to the expiration of Bayer's patent. Bayer paid Barr a lump sum payment and agreed to either supply Barr with Cipro for resale, or make payments to Barr through December 2003. Consistent with the decisions by the Second and Eleventh Circuits, the Federal Circuit concluded that a rule of reason approach was appropriate and that "[t]he essence of the inquiry is whether the agreements restrict competition beyond the exclusionary zone of the patent." The appellate court affirmed the trial court's conclusion after a similar inquiry, that the plaintiffs had not shown that the agreement was anticompetitive.

C. "Reverse Payment" and "Exclusion Payments" Are Misnomers

Before presenting our economic analysis of reverse payment settlements, it is useful to examine the "reverse payment" moniker itself. Such settlements were baptized by commentators who believe that a payment from the branded manufacturer to the generic manufacturer flows the "wrong" way. In a typical settlement of a patent lawsuit, this argument points out, the alleged infringer pays the patent holder (a lump-sum payment and/or a license fee), while in a reverse payment settlement the patent holder (branded manufacturer) pays the alleged infringer (generic manufacturer).

But this label is based on flawed logic. Hatch-Waxman creates an unusual circumstance in the pharmaceutical industry where the patent holder (branded

or "partial" settlement, the litigation continues but the generic manufacturer agrees not to launch "at risk" while the litigation is ongoing. For a more complete discussion of the competitive implications of interim settlements, see Langenfeld, James and Li, Wenqing, "Intellectual Property and Agreements to Settle Patent Disputes: The Case of Settlement Agreements with Payments from Branded to Generic Drug Manufacturers," *Antitrust Law Journal*, 70, 2003, pp. 777-818.

⁵¹ *In Re: Tamoxifen Citrate Antitrust Litigation*, 29 F.3d 370 (2d Cir. 2005).

⁵² *In Re: Ciproflaxin Hydrochloride Antitrust Litigation* (Fed Cir. 2008).

manufacturer) can sue the alleged infringer (generic manufacturer) before the alleged infringer markets a product.⁵³

In the typical patent case – indeed, in any patent case – the alleged infringer is going to require some compensation for abandoning the litigation.⁵⁴ In a typical case where the patent infringer has been on the market for a significant period of time and would owe significant damages if found liable, the parties may agree to a settlement where the infringer pays damages to the patent holder, but those damages are far less than the damages the patent holder is seeking. In this case, the patent holder pays the infringer to settle the lawsuit by accepting lower damages – this payment is just obscured by the fact that on net some cash flows from the infringer to the patent holder. Reverse payment settlements can be thought of in the same way, but the Hatch-Waxman framework means the patent holder typically does not incur any damages from sales of the infringing products, and so the net payment flows from the branded manufacturer to the generic manufacturer. Since nothing nefarious can be gleaned from the simple fact that the payment flows in a particular direction, one must examine the underlying economics of these settlement agreements.

Similarly, the term “exclusion payments” does not accurately reflect the nature of many of these deals. If the branded manufacturer holds an ultimately valid patent, and the parties settlement allows the generic manufacturer to enter the market prior to patent expiration (but after the generic manufacturer preferred to enter), then the generic was not “excluded” in any meaningful way. The patent itself provided the ability to exclude, not the payment.

D. Basic Economic Model

The framework presented above for an analysis of patent settlements can be used to evaluate reverse payment settlements as well. We start with the highly simplified case

⁵³ Generic manufacturers can “enter at risk” – that is enter before final judgment in the patent litigation – but this is the exception rather than the rule. For example, Mr. Downey testified that Barr never enters at risk (Testimony of Bruce Downey, p. 24).

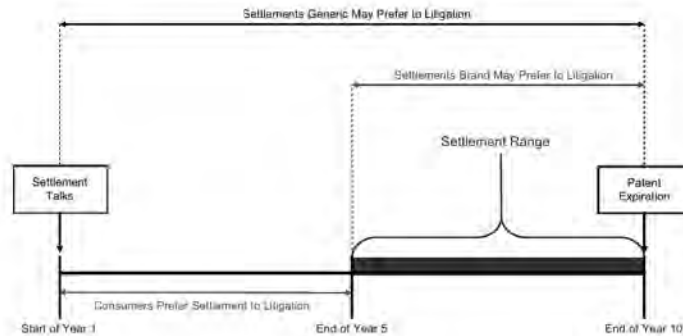

⁵⁴ Crane, Daniel A. “Correspondence: Ease Over Accuracy in Assessing Patent Settlements,” *Minnesota Law Review*, 88, 2004, pp. 698-711; Schildkraut, Marc G. “Patent-Splitting Settlements and the Reverse Payment Fallacy,” *Antitrust Law Journal*, 71(3), 2004, pp. 1033-1068.

outlined in Figure 1 – no litigation costs, full information, and risk neutrality – and relax only the assumption requiring the only term of settlement to be the date of generic entry and allow settlements to include cash payments. How will this affect the range of settlements?

Monopoly profits (profits when only the brand is in the market), will typically be larger than profits when the brand and the generic are both in the market. Of course, branded pharmaceuticals are not necessarily monopolies before the entry of generics, because patents give only a limited right to exclude identical competition and because they may compete with other branded or generic manufacturers. Nonetheless, thinking about analogy to monopoly profits can provide intuition as to why the parties may have an incentive to agree to delay generic entry. A year of delay will be worth more to the branded manufacturer (because it gains a year of “monopoly” profits) than it costs the generic manufacturer (because it loses a year of contested profits), so there will be settlements that delay entry beyond Year 5 that both parties prefer to litigation. As shown in Figure 5, this expands the range of settlements that the brand and generic manufacturers could potentially agree to, but only to include generic entry dates later than Year 5. Consumers will be clearly worse off under these settlements. Of course, without knowing the precise strength of the patent, observed terms of a particular settlement agreement could be consistent with delayed generic entry, as shown in Figure 5, or with a procompetitive settlement where generic entry occurs sooner than would be expected with litigation.

Thus, a model that ignores real-world complexities can lead to the conclusion that a settlement with cash payments from the brand to the generic can harm consumers. In the next section, we extend the basic model – as we did in the earlier section – to account for the additional complexities that drive real-world settlements. This analysis demonstrates that relying on the overly simplistic framework discussed above can frequently lead one to draw incorrect conclusions as to the competitive effects of a patent settlement.

Figure 5
Settlement with Generic Entry Date and Cash Payment

E. Introducing Real-World Complexities to the Basic Model⁵⁵

1. Overview

Expanding the model to account for other real-world factors demonstrates that settlements with reverse payments can be procompetitive. In fact, under certain conditions, without the bargaining tool of a payment from the branded manufacturer to the generic manufacturer, the parties will be unable to reach agreement on a settlement – even if that settlement would benefit consumers.

Many economists that have written on this subject agree that when real-world complexities are taken into account, reverse payment settlements can be procompetitive.

⁵⁵ This section draws on the work of Robert Willig and John Bigelow. See Willig, Robert D. and Bigelow, John P., "Antitrust Policy Toward Agreements that Settle Patent Litigation," *The Antitrust Bulletin*, pp. 655-698, (Fall 2004); Bigelow, John P. and Willig, Robert D., "Reverse Payments in Settlements of Patent Litigation: Schering Plough, K-Dur and the FTC," *The Antitrust Revolution: Economics, Competition, and Policy*, 5th Edition (2008) ("Bigelow and Willig (2008)").

Shapiro (2003) explained:

This is not to say that such payments are necessarily anticompetitive if other factors are brought into the analysis, such as risk aversion and asymmetric information about market conditions, as 'reverse cash payments' may be important in more complex settings for successful settlement.⁵⁶

Bigelow and Willig (2009) share a similar view:

It also follows from economic logic that the opportunity to employ reverse payments may be necessary for socially beneficial and procompetitive settlements to be reached, due to such common situations as asymmetric information, excess optimism, and differential cash needs between the parties to the patent dispute.⁵⁷

Executives in the pharmaceutical industry have expressed similar views. For example, Bruce Downey, the CEO of generic manufacturer Barr Pharmaceuticals, testified to Congress that if a law were passed prohibiting reverse payments "there would be very, very few settlements."⁵⁸

2. *Cash payments with litigation costs and/or risk aversion*

As described above, litigation costs and risk aversion can be important real-world factors to consider in evaluating patent settlements. Accounting for litigation costs and/or risk aversion expands the range of settlement agreements that each party is willing to accept. As shown in Figure 6, these factors expand the range of potential settlements that branded manufacturers will accept (relative to Figure 5), and by creating incentives for branded manufacturers to settle on terms more favorable to consumers it becomes clear that settlements with reverse payments can be procompetitive.

⁵⁶ Shapiro (2003), p. 408.

⁵⁷ Bigelow and Willig (2008), p. 35.

⁵⁸ Testimony of Bruce Downey, p. 28.

Figure 6
Settlement with Generic Entry Date and Cash Payment
Litigation Costs

3. Cash payments with a cash-strapped generic

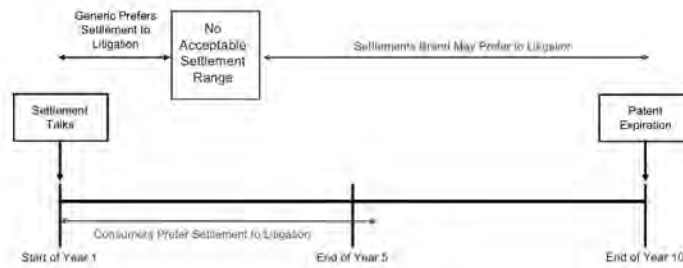

Some observers have argued that, while reverse payment settlements can leave consumers better off than continued litigation, there is always a feasible alternative settlement without a payment (where the parties simply agree on an entry date) that will leave consumers better off than either litigation or a reverse payment settlement. Under this argument, a prohibition on reverse payment settlements would unambiguously leave consumers better off while still allowing the parties to reap the benefits of settlement. This argument ignores the complexities of settlement negotiations.⁵⁹ In the presence of such complexities, additional flexibility in negotiations may be *essential* to enabling a

⁵⁹ A related argument is that an alternative settlement with a different payment and a different entry date may be better for consumers. However, this argument ignores the fact that antitrust regulators consider the implications to competition of an agreement among competitors (such as a reverse payment settlement) versus a but-for world without the agreement, not against an optimal agreement. See Department of Justice and Federal Trade Commission, "Antitrust Guidelines for Collaborations Among Competitors," April 2000, p. 4, 7, and 10.

pro-consumer settlement between the parties. That is, under these circumstances, without a reverse payment the parties would be unable to reach a settlement at all.

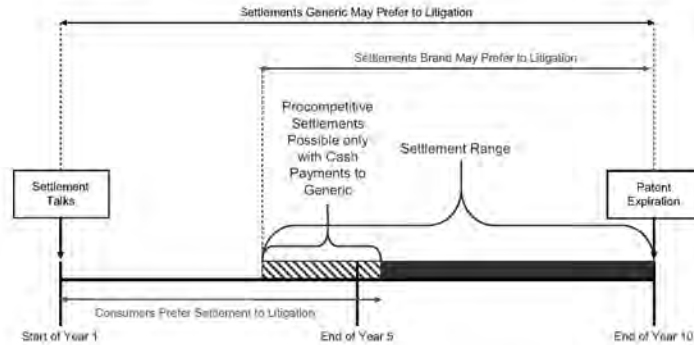

Two real-world complexities ignored by the basic model are the time value of money and the possibility of liquidity constraints. The time value of money refers to the fact that individuals prefer a dollar received today to dollar received in the future; thus they discount the value of future cash flows. Imagine a small, cash-strapped generic entrant that is having a difficult time raising needed capital from the financial markets. As a result, the entrant discounts future profits very heavily; in other words, since it needs cash, it values near-term profits very highly. This generic manufacturer will only accept settlements that allow for relatively early entry, which under the conditions of the example illustrated in Figure 7a would not be acceptable to the branded manufacturer.

Figure 7a
 Settlement with Generic Entry Date and No Cash Payment
 Cash-Strapped Generic and Litigation Costs/Risk Aversion

The latest entry date to which the cash-strapped generic would be willing to agree is earlier than the earliest date to which the branded manufacturer would be willing to agree. As a result, settlement talks would break down.

Figure 7b
 Settlement with Generic Entry Date and Cash Payment
 Cash-Strapped Generic and Litigation Costs/Risk Aversion

A cash payment by the branded manufacturer may allow the branded and generic manufacturers to bridge the settlement gap shown in Figure 7a. The branded manufacturer would be willing to include a cash payment in the settlement in exchange for a later generic entry date. The generic manufacturer would be willing to accept later entry in exchange for a cash payment. As described above, the incremental profits that a branded manufacturer would receive because of postponed generic entry would be higher than the incremental profits that the generic manufacturer would lose from delaying its entry to a more competitive market. Thus, a given cash payment will move the range of entry dates that the branded manufacturer is willing to accept later in time, but it will move the dates the generic is willing to accept by an even greater amount. Such a payment will bring the parties closer together and could bridge the settlement gap between the two parties. As shown in Figure 7b, under these circumstances, reverse payments can lead to a range of settlements that would not have been otherwise feasible.

Importantly, many of these newly conceivable settlements would benefit consumers by resulting in a generic entry date earlier than that expected with continued litigation.

4. Cash payments with an optimistic generic

Cash payments can also help bridge settlement gaps arising under other circumstances. For example, imagine a generic manufacturer that, despite actual odds of winning the patent suit of only 50 percent, believes that it in fact has a 75 percent chance of winning. This mismatch of beliefs and actual probabilities could create a situation similar to that depicted in 7a, where (absent a reverse payment) the generic manufacturer would not be willing to accept any settlement terms the branded manufacturer would be willing to offer because the generic manufacturer has an unrealistic belief about its chance of winning if it holds out and continues to litigate. Just as with a cash-strapped generic, a reverse payment can potentially bridge the settlement gap and lead to a settlement that benefits consumers. Of course, it is possible that the branded manufacturer is also overly optimistic about its odds of success in the litigation, which would reduce the range of procompetitive settlements that a cash payment could generate. Our point here is not that these are the only scenarios that could play out, but rather that there are reasonable scenarios under which a patent settlement with a reverse payment can benefit consumers.

5. Cash payments with information asymmetries

The sets of information known by the brand and the generic manufacturer almost certainly differ significantly, and often in important ways. Willig and Bigelow (2004) describe how this information asymmetry can create another circumstance where cash payments can facilitate a procompetitive settlement agreement that would not otherwise be feasible.

Imagine that the branded manufacturer has private information about the effective life of the patent – for example, about the prospects of future competition from other branded products that would reduce or eliminate demand for the product at issue in the patent litigation. The generic entrant knows that the branded manufacturer is better informed about future competition, and therefore will interpret settlement offers from the branded manufacturer with this in mind.

Suppose there are two types of patents: “high-value” patents, where there is no chance that other branded competitors enter before the patent expires, and “low-value” patents, where there is a decent chance that such brand-name entry happens, significantly reducing the effective life, and the value, of the current patent. The branded manufacturer knows which type of patent it holds, but the generic manufacturer does not.⁶⁰ In the case of a low-value patent, agreeing to a compromise entry date may have little benefit to the generic because the market may be eliminated by future competition. So a generic may be wary of accepting a reasonable settlement offer because it worries that that settlement may indicate that in fact the patent is low value – and the generic would be better off continuing to litigate.

The problems created by information asymmetries can be overcome if the branded manufacturer is allowed to provide a cash payment to the generic manufacturer. In our example, only branded manufacturers with high-value patents would find it profitable to offer an up-front payment to the generic. Thus, the generic can interpret the reverse payment as a signal that the patent is high value, and have strong reason to believe that the settlement offer is in fact a good offer from a branded manufacturer with a high-value patent, rather than a poor offer from a branded manufacturer with a low-value patent. Here again, cash payments can facilitate settlements – including procompetitive settlements – that would not be reached if such payments were not allowed.

6. *Collateral business agreements*

Many settlements between branded and generic manufacturers involve collateral business agreements. These agreements may take a variety of forms, including:

- Branded manufacturer licenses products from the generic manufacturer;
- Generic manufacturer licenses products from the branded manufacturer;
- Generic manufacturer agrees to co-promote one or more of the branded manufacturer’s products; and/or

⁶⁰ Economic models on this point often assume that the branded manufacturer knows the type of patent it holds with certainty. However, the results depend not upon this assumption (as there may be some uncertainty even on the part of the branded manufacturer) but only that the branded manufacturer will have better information on the type of the patent than the generic manufacturer.

- Generic manufacturer agrees to serve as supplier for the branded manufacturer.

Such collateral agreements can be helpful in facilitating settlements by allowing the parties to get around some of the complexities discussed above that may otherwise pose obstacles to successful settlements like information asymmetries and differences in expectations. Unlike cash, the parties' valuations of the components of a collateral business arrangement may be quite different. This difference in valuation could be used to offset different expectations in the patent litigation to arrive at a settlement. In addition, these collateral agreements could in and of themselves benefit consumers, bringing together business partnerships that would not be possible with continued litigation. But while these collateral agreements can serve to facilitate settlements, they could also, in theory, contain "effective" payments that are designed to delay entry of the generic, if the generic manufacturer is over-compensated for what it is providing or the branded manufacturer is under-compensated for what it is providing.

In recent years, patent settlements with collateral business agreements have received significant regulatory and legal scrutiny. For example, as described above, the agreement between Schering and Upsher that was challenged by the FTC did not involve an isolated cash payment to the generic. Rather, in settling the patent dispute, Schering also licensed five different products from Upsher, including Upsher's Niacor SR, in exchange for royalty payments of \$60 million.⁶¹ The FTC argued that the \$60 million royalty payments were well above the value of the licensed products, and that the payments were just another means to delay generic entry.⁶²

Evaluating the competitive implications of settlements with collateral business arrangements is even more complicated than those with cash payments. Such an analysis first requires an evaluation of the collateral business transaction to determine a reasonable assessment of the market value of the transaction. To the extent that it is clear from the evidence that the generic was over-compensated or the brand was under-compensated,

⁶¹ *Schering-Plough v. FTC*, 402 F.3d, at 1060.

⁶² Ultimately, the Appeals Court concluded that the FTC did not convincingly demonstrate that the \$60 million was not simply a royalty payment within the range of fair market value for the licensed products. See *Schering-Plough v. FTC*, 402 F.3d, at 1068.

then the difference between the payment and the arms-length value of the transaction can be thought of in the same way as a “reverse payment.” Collateral business transactions, just like reverse payments, therefore can be anticompetitive, but they can also serve to produce procompetitive outcomes, some of which may not have been otherwise feasible.

IV. LONG-RUN COMPETITIVE EFFECTS

The discussion to this point has focused on the short-run competitive effects of patent settlements. Clearly, patent settlements can be procompetitive, even when focusing on short-run competition. Patent settlements can also have important long-run competitive effects. First, the scope of patent protection can affect future incentives for branded manufacturers to invest in additional R&D. Patents give patent holders, such as branded pharmaceutical manufacturers, the right to litigate claims against alleged infringers, and the right to settle such litigation – at least as long as such a settlement does not exclude competition beyond that allowed by the patent. Broad-brush limits on the types of patent settlements that are allowed by pharmaceutical manufacturers would likely result in a narrowing of the patent protection currently provided to patent holders. As described above, such patent protection is an important component of pharmaceutical manufacturers’ incentives to invest substantial sums in R&D and to introduce new medications. To the extent that limits on patent settlements reduce incentives to invest in pharmaceutical R&D, consumers may suffer significant adverse effects in the long-run, in the form of a smaller number of new medicines that become available.⁶³

Second, the availability of procompetitive settlements can provide further incentives to generic manufacturers to challenge branded patents and bring lower-priced generic drugs to market. Patent litigation can be expensive and risky, particularly for small firms. Restricting the range of settlement options will reduce the ability of generic manufacturers to settle these cases and increase the cost and risk of bringing a generic drug to market. On the margin, this will lower the incentives of generic pharmaceutical

⁶³ For a more extensive discussion of these effects, see Langenfeld, James and Li, Wenqing, “Intellectual Property and Agreements to Settle Patent Disputes: The Case of Settlement Agreements with Payments from Branded to Generic Drug Manufacturers,” *Antitrust Law Journal*, 70, 2003, pp. 777-818.

manufacturers to challenge branded patents in the first place.⁶⁴ Even if the effect on a particular generic manufacturer's decision is relatively small, the collective impact on future generic competition can be substantial.

V. POLICY IMPLICATIONS AND CONCLUSIONS

Designing a workable framework that distinguishes procompetitive settlements from anticompetitive settlements is difficult – in part because at its core this depends upon the validity of the patent claims. A settlement agreement whereby the generic manufacturer agrees to enter in, say, five years – but five years before patent expiration – might be anticompetitive if the patent was weak (*i.e.*, if the generic had a high probability of winning at trial). But the same settlement terms might be procompetitive if the patent was strong (*i.e.*, if the generic had a low probability of winning at trial). Ultimately, an evaluation of the competitive effects of a patent settlement cannot avoid at least some investigation into the merits of the patent litigation.

While antitrust economists generally agree with this line of argument, some analysts have suggested prohibiting settlements with “reverse payments.” Bills have been introduced in at least the last two Congressional sessions that would do just that.⁶⁵

However, as we explain above, under many circumstances, patent settlements between branded and generic manufacturers – even those involving reverse payments – can benefit competition and consumers. An outright prohibition of reverse payment settlements would harm consumer welfare in a range of circumstances. Indeed, prohibiting settlements with cash payments could simply lead to a shift to settlements with other business arrangements which are even more complicated to evaluate, which makes enforcement of potentially anticompetitive arrangements even more difficult to assess. Efforts to prevent settlements with any compensation (whether in the form of cash or compensation from other business arrangements) flowing from the branded manufacturer to the generic would similarly block many pro-consumer settlements. Of

⁶⁴ See, for example, Judge Posner's opinion in *Asahi Glass Co., Ltd. v. Pentech Pharm., Inc.*, 289 F. Supp. 2d 986, 994.

⁶⁵ See, for example, Preserve Access to Affordable Generics Act, S.361, 110th Cong. (2007).

course, an outright prohibition on such settlements would reduce the uncertainty and litigation costs that may follow from antitrust challenges to such settlements. But it is not at all clear that these savings would outweigh the harm created by eliminating potentially procompetitive settlements. “Quick look” or “safe harbor” approaches (whereby settlements with certain characteristics are presumptively anticompetitive or procompetitive, while leaving open the opportunity to rebut this presumption) could reduce these costs while still allowing procompetitive settlements.

Moreover, a restrictive policy approach that sought to bar reverse payment settlements would not only have short-term impacts by preventing procompetitive settlements, but may harm consumers in the long-run by reducing the incentives of branded manufacturers to continue to develop innovative new drugs, and reducing the incentives of generic manufacturers to challenge weak patents and bring generic drugs to market sooner.

Patent settlements between branded and generic pharmaceutical manufactures can be anticompetitive and should continue to be closely scrutinized by the antitrust authorities and the courts. Indeed, current law requires that the terms of any relevant patent settlement agreement be provided to the FTC and the DOJ. But painting all settlements with the same brush is likely to harm consumers. Instead, more individualized treatment is appropriate, whereby the competitive effects of a particular settlement are evaluated by applying an economic framework, such as that presented here, to the facts specific to that settlement.

Mr. JOHNSON. Thank you. Thank you, Mr. Dickey.

And I will begin by affording myself appropriate amount of time to ask some questions.

For the entire panel, do you think Hatch-Waxman intended brand drug companies to introduce authorized generics during the 180-day exclusivity period? Or are the brand companies exploiting this loophole in the law? If so, should the loophole be closed? And how should that be done?

And we will start with Mr. Feinstein.

Mr. FEINSTEIN. Thank you, Mr. Chairman.

As Ms. Bresch indicated in her statement, the commission is conducting a study of the authorized generic issue in real time. And we are hopeful that at least the preliminary results of that study will be released later this month.

It would be, I think, both premature and inappropriate for me to offer a preview of that both because I don't know it and also because it is still a work in progress. But I can assure you that the issues relating to the competitive effects of authorized generics are being closely examined as we speak, and the FTC will be coming forward with at least a preliminary reaction to that analysis or report on that analysis very shortly.

Mr. JOHNSON. Ms. Bresch?

Ms. BRESCH. Thank you. I absolutely believe that the intent of Hatch-Waxman did not mean for there to be able to be more than one person in the market during that first 180 days. Obviously, exclusive, I think, in most dictionaries means one. In fact, the Medicare Modernization Act of 2003 went so far to address shared exclusivity, which is also something that was somewhat of a compromise between the brand and generic companies in certain situations where we do end up coming to the market with several generics.

So the term 180-day exclusivity, we absolutely believe the intent of the law was to mean one. And it definitely serves as a huge detriment to the generic industry and, as I said in my testimony, has affected negotiations in every way as we look at patent settlements.

So as I had said, I don't think we would be here today had we closed that loophole in 2003. Unfortunately, we are sitting here years later and realizing that the effects that a generic and a brand company have and the leverage and how the table has been turned to really unbalance Hatch-Waxman has had a huge detriment.

And as I said, I can honestly say that there would have been settlements that we would not have settled litigation had it not been for the threat of that authorized generic. And it would have allowed us to bring a generic perhaps sooner to the market had we won that litigation.

Mr. JOHNSON. Thank you.

Mr. Kennedy?

Mr. KENNEDY. As a small manufacturer and a family-owned business, I deal with this—I deal with this problem every day. It is my responsibility, as the head of the family, to try and be able to get another generic drug to market.

The examples that I gave in my testimony of how prices were reduced when they are able to come to market, an example of how we cannot reduce prices on drugs if we are not able to get there. I feel like that definitely, you know, Hatch-Waxman has, you know, the intent was never to prevent generic companies from coming to market.

But the more cases I read about every day and my involvement in this every day, I have come to realize that is the main weapon that a name-brand company has to be able to extend their patents. To file another patent, it may be a weak patent, but if you make the reverse settlement, then the smaller guy down the road is never going to get to market. And you have to have more than one or two people in the market to lower your prices.

Mr. JOHNSON. Thank you, sir.

Mr. Donatiello?

Mr. DONATIELLO. Thank you, Mr. Chairman. Thank you, Mr. Chairman.

I don't know what was contemplated when Hatch-Waxman was originally passed, but I think in general the presence of an authorized generic on the market during the 180-day period reduces the cost of the generic. And so, instead of being just one generic on the market, there are two. And when there are two generics, the cost is reduced.

In general, therefore, I think that authorized generics are pro-competitive or good for consumers because they reduce the cost of the generic during this period.

Mr. JOHNSON. Thank you, sir.

Mr. Vaughan?

Mr. VAUGHAN. We don't think it was the intent of Mr. Waxman or Mr. Hatch. We think it is an abuse. Why not give the true generic 180 days and not let the authorized generic market during that period? There has got to be some way to stop this.

Mr. JOHNSON. Last but certainly not least, Mr. Dickey?

Mr. DICKEY. I don't know to what extent Hatch-Waxman contemplated authorized generics. What I can say is, is that, as a matter of economics, there are two competing effects that authorized generics generate. One is the addition of a second generic competitor on the market during the 180-day period increases competition and lowers prices.

There is also the potential that that authorized generic reduces incentives to bring patent challenges and to bring other generics to market. And so the ultimate effect is the net of those two competing effects. And I think the FTC study that will be coming out will be a useful first step in examining how these two effects net out.

Mr. JOHNSON. All right. I will withhold any further questions myself.

I will turn it over to our Ranking Member for questions that I am sure that he has about this.

Mr. COBLE. Thank you, Mr. Chairman. Good to have all the panelists with us this morning.

Mr. Donatiello, if generics and brands could not settle, how would this effect innovation and the cost of pharmaceuticals for consumers?

Mr. DONATIELLO. Thank you, Congressman Coble. We think that inability to settle will reduce—it will increase the business risk associated with these litigations. And, therefore, it will, in effect, make generics hesitate because, once you get into one of these litigations, when you reduce the incentive to settle, it becomes more of an all-or-nothing proposition.

And so when you go into one of these, you really have to think hard about exactly what your exit strategy is. Instead of going all the way through the litigation, there is significant cost associated with the litigation, costs that could be put back into innovation for new generic products. There is significant risk associated with it.

We had a situation where we were on the generic side of an issue. We took the case to trial and won at trial. We took the case to appeal and won at appeal.

After getting to appeal and winning, we launched—because the law said that we needed to or we would lose 180 days, the court of appeals for the Federal circuit reversed itself without even taking further argument. And now we are looking down the barrel of possibly a very large damages award against us, when we thought that we had done everything right.

And we ended up settling that case. Part of the settlement was the brand manufacturer's allowance for us to continue to sell out our stock for the rest of that year. That would have been illegal under the proposed legislation.

So, instead, we would have had to take that through trial with the possibility of a very large verdict against us, and we are a small company. That very well might have ruined the company had we not been allowed to settle that litigation in some logical manner.

And, therefore, I think that the inability to settle significantly increases the risk and makes a generic really think about whether they need to go forward with a particular project or not.

Mr. COBLE. And the second part of my question was the ultimate cost to consumers.

Mr. DONATIELLO. Again, by reducing the incentive to bring these challenges because it becomes an all-or-nothing proposition, then in some instances those challenges may not be brought and the generics may not ultimately come to market because, with the increased risk of an all-or-nothing proposition, I think that in some instances those projects may not be undertaken and the generic may not end up challenging the patent in order to get that generic to market.

Mr. COBLE. Thank you.

Mr. Dickey, if all Hatch-Waxman challenges had to be litigated to the end of case, that is, to final judgment of the validity of the patent, how would those increased transaction costs be absorbed by the companies, A? And, B, would those costs likely to be passed on to consumers during the initial exclusion period of the patent?

Mr. DICKEY. Being forced to litigate to conclusion would certainly increase the litigation costs and the risk associated with the litigation to the manufacturer, likely significantly, as patent litigation these days is quite expensive.

And it is likely that some of that cost is borne by the manufacturers, but also that some of it is passed on to consumers in the form of higher prices. So that is why economists widely agree that, in general, settlements can be procompetitive, because they save these costs and reduce this uncertainty.

Mr. COBLE. Thank you.

I yield back, Mr. Chairman.

Mr. JOHNSON. Thank you.

Next in line would be Mr. Gonzalez, out of Texas.

Mr. GONZALEZ. Thank you very much, Mr. Chairman.

A question—we will go to Mr. Dickey. And I apologize. I had to leave the room as you were giving the last part of your testimony. And the question I had for you—in your analysis, in the paper that

you prepared, were you able to come up with any figures as far as how many of these settlements resulted in getting generics into the marketplace sooner rather than later?

Because I know Mr. Donatiello has testified that, in many cases, part of the settlement does allow the challenged generic to hit the marketplace earlier. So do we have numbers out there?

Mr. DICKEY. Our study didn't look at numbers of settlements. I think, in general, most of these settlements have brought a generic to market sooner than the expiration of the patent.

The more difficult question is whether these settlements bring a generic to market sooner than the expected outcome of litigation would have. And in that case, I think, you know, some do and some may not, and that is why I think that we need to continue to scrutinize these settlements, but not paint them all with the same broad brush.

Mr. GONZALEZ. And maybe that is the distinction, is what is the benchmark? You know, sooner than the patent expired or so and—I mean, that is all part of the—of the litigation and the factoring in of the settlements. I think that is actually a little harder to quantify.

And I will ask Mr. Donatiello to tell me why he believes that actually facilitates or accommodates marketplace availability of generics earlier rather than later.

Mr. DONATIELLO. Thank you, Congressman Gonzalez.

I think it is true that, in many of these settlements, a generic gets to market sooner than it would have had it waited until patent expiration—statistics that we have show that, in cases litigated through trial, half of those cases were won by brand companies.

So if you extrapolate that into the settlement, then in those settlements, the generic is getting to market sooner than it would have otherwise. That gets the generic to market several years before patent expiration and gets it—and gets that savings into the hands of consumers that much sooner. And that is how we see it, it working there.

Mr. GONZALEZ. You could say that that would be the case because half of the time the brand prevails in lawsuits, so you could extrapolate, as you say. Of course, on the other hand, you could say that 50 percent—it is almost a wash if you think in those particular terms.

I do have—and this is a question, Mr. Dickey. Is every patent lawsuit filed in good faith?

Mr. DICKEY. I don't think that is a question I can answer.

Mr. GONZALEZ. Well, I will tell you. I mean, any lawyer is going to tell you that. You know, lawyers are subject to all sorts of disciplinary action for filing something not in good faith, but we all know lawsuits are filed in America every day, in essence, to gain some sort of advantage or for delay.

And it is just, that is the real world. And whether judges can, you know, wade through it, at some point in time, that does happen. But believe me, there is a whole lot of litigation costs involved, and many times settlements are extracted because of the disparity between the parties and their ability to defend a lawsuit.

And that is the reality. And I think what we are doing in Energy and Commerce and at one Subcommittee level today with 1706 that addresses a reality up there.

Ms. Bresch, this thing about the 180 days and the authorized generics and such, obviously you don't agree with Mr. Donatiello who doesn't believe that it really in any way hinders the introduction of generics and such, but actually accommodates it. Do you want to respond to that again?

Ms. BRESCH. Sure.

Mr. GONZALEZ. And I missed the earlier question by the Chairman of the Subcommittee, and I apologize.

Ms. BRESCH. That is okay. Sure. I believe that it absolutely—if you look at the authorized generics, what really brings consumer savings is the entry of the first generic, because that is due to time. So, typically, whether it is through the patent settlement or through winning the litigation case, that generic is coming to market many, many years prior to the actual patent expiration in some cases.

So what really affords the consumer that first bolus of savings is that first generic entrant. And what we are saying is that what the law very much intended was for that effort to give us 180 days. And then after that, on day 181, you can have anywhere from 2, 4, 10 competitors, which, as he notes, does reduce the price even further.

But I think that if you look at the years of monopoly that a brand company has to recoup their costs in developing a product is the same that we are asking for in that 6-month period to recoup ours. So the idea that the brands now can put a generic in there to compete with us on day 1 through day 181, that is what has completely changed the negotiation table for us at patent settlements and litigation.

Mr. GONZALEZ. Thank you very much.

Thank you, Mr. Chairman.

Mr. JOHNSON. Thank you, Mr. Gonzalez.

And, ladies and gentlemen, I have committed a cardinal sin today. I went to Mr. Gonzalez with Chairman Conyers seated right beside me. And so I am sure that he will have a few words for me at the conclusion of this hearing.

And I thank Mr. Goodlatte for agreeing that this is appropriate. Thank you.

Mr. CONYERS. This is a funny kind of a hearing going on here. The Chairman doesn't know who—oh, this doesn't work? Okay. The Chairman doesn't know who I am. I have heard more delicate dancing around here. I am sure glad—well, I don't want to say I am glad I missed the witnesses statements.

But, look, folks, drugs are too expensive. Generics are cheaper. Several months make drugs more expensive. The Rush-Waxman bill draws a bright line, because it abolishes settlement.

Now, Mr. Vaughan, is that a fair description of what all these folks are sitting in the room about here today?

Mr. VAUGHAN. I think so, sir. I thank you for inviting me, because I think you have given me a business plan I could go talk to my bosses in Yonkers about.

You know, we evaluate and rate things. And I was thinking, we could go to the appliance makers at G.E. and we could say, "This year, we were thinking about evaluating your refrigerator, but, gee, if you could pay us some money, we won't do it this year." And I know our readers might be disappointed at the blank pages in the magazine, but what a great way to make some money.

So I think, sir, you are on to something.

Mr. CONYERS. Mr. Kennedy, what kind and friendly words would you have for Ms. Bresch if we weren't in a Committee hearing?

Mr. KENNEDY. Well—but I disagree on the savings of these generics and that first 180 days. Sure, there is going to be some savings from the name brand, as I said. And that may be approximately 20 percent.

But the point that you are getting to, you know, drugs are expensive. Health care costs is expensive. What can we do to lower the cost? Well, your costs on generic medication does not drop drastically until you get three or four competitors in the market.

As long as we permit these settlements, the original holder of the NDA or the patent will defend that patent for them. They will keep defending that. So I cannot come to market until the patent is defeated.

So as a small generic company—manufacturer, I am out here waiting on somebody to defeat that patent before I can even get the market to create the savings.

So I am the fourth or fifth person to come to market, but I can't get there until the patent is defeated. And so as long as you have these agreements, the patent is not defeated. That is why I feel like, if anybody is going to get 180 days, I feel like they should get 360 or get a year for the person that defeats the patent.

Mr. CONYERS. Do you agree, Mrs. Bresch?

Mr. KENNEDY [continuing]. You should have that.

Mr. CONYERS. You okay on that?

Ms. BRESCH. No. [Laughter.]

No, I—

Mr. CONYERS. What is the slight problem?

Ms. BRESCH. I think that, well, if you talk about his first-to-win approach, it is very impractical. I think that, you know, as you all very well know, there are many different courts and many different jurisdictions. You would be having this race to docket, forum shopping. I don't think it promotes any certainty at all, which is what Hatch-Waxman has gone to great lengths to do.

So I think that small generic companies, medium-sized generic companies, and large generic companies all have the same ability to be that first to file, which affords the 180-day exclusivity. So he has every much the ability to be the first generic filer, as he does to be the fourth generic filer.

So, again, my contention is, getting that first generic to market is what brings consumer savings.

Mr. CONYERS. But Judge Gonzalez asked a very simple question. And I got lost on what the answer was. But you know a lot of lawsuits are filed, you know, not for very valid reasons. I mean, that is pretty elementary.

Mr. Vaughan, how do we climb out of this mess?

Mr. VAUGHAN. Sir, I think H.R. 1706 is pretty darn good, and it has that exception for the cases where Mr. Dickey may be right, for the FTC to work on it. And I would trust them with the public interest.

We endorse a lot of generics, but we don't trust either industry further than we can throw them. And we need the FTC in there to help consumers on this.

Mr. CONYERS. Okay, last word to Mr. Feinstein.

Mr. FEINSTEIN. Thank you, Mr. Chairman.

Let me first make it very clear that this legislation and the position of the FTC on this issue is not that parties cannot settle their patent lawsuits. Our position is that parties cannot enter into settlement agreements which have this pay-for-delay feature. That is the problem. That is what is causing delay of generic entry, and that is what is taking money from the pockets of consumers and the taxpayers.

I just want to be clear: There have been some other panel members who have suggested that this legislation would ban all settlements. That is simply not correct. And I hope that that is well understood.

Mr. CONYERS. Well, I conclude drugs cost too much. I mean, this is the most profitable industry—you can make more profit on drugs, pharmaceuticals than you can on oil, the most profitable.

And you have 47 million people without a dime's worth of insurance. You have Medicaid—doctors refuse to take Medicaid. As a matter of fact, some are getting a little iffy about Medicare. The President has ordered us to come up with a new health bill.

Pharmaceuticals are a huge part of the problem here. And I guess I need to talk with Mr. Vaughan some more about this, because we have to make drugs prescribed more available to people. That is what this hearing should be about.

And I don't know how well we are getting here today, Mr. Chairman. Where did you get these witnesses? [Laughter.]

Mr. FEINSTEIN. Mr. Chairman, might I just respond to that for a moment?

I actually want to just say that I agree with you, that the goal here is to act in the best interests of consumers. And the FTC's position is that these—the deals—the pay-for-delay deals are contrary to the best interests of consumers. This legislation goes a long way to solving that problem.

And I just—I don't want there to be any misunderstanding about where the FTC is coming from on this issue.

Mr. CONYERS. Thanks, Mr. Chairman.

Mr. JOHNSON. Mr. Chairman, thank you.

And, you know, we dug up these witnesses from the bottom of the barrel. We decided that just they are—you know, give the lesser of us an opportunity to come to Congress. I am sure that their families and everyone else are quite proud of them. And— [Laughter.]

Mr. FEINSTEIN. I suspect that quote will be used against me by my children, Mr. Chairman.

Mr. JOHNSON. Okay.

Mr. Goodlatte?

Mr. GOODLATTE. Thank you, Mr. Chairman. I find this panel to be very entertaining and very enlightening in most regards.

However, Mr. Vaughan, I was taught in my debate and speech classes in college that analogy is the weakest form of argument. Consumers Union does not make refrigerators or microwaves or whatever. You sell information. You sell ratings.

But brand manufacturers of pharmaceuticals and generic manufacturers of pharmaceuticals both sell drugs. And they have inevitably encountered for a variety of reasons disagreements about whether or not a patent is valid.

And to me, to limit the ability of these entities to arrive upon settlements and both time of entry and payment for lost business opportunities are both very common elements of settlements of many different kinds.

So let me ask Mr. Feinstein here: Why should the Congress adopt a policy, namely a per se ban on patent settlements, involving consideration other than the date of entry that three out of four Federal courts of appeal that have considered the matter have already rejected? Hasn't antitrust policy in this country largely shifted away from such per se rules?

Mr. FEINSTEIN. Well, with respect, Congressman Coble, we believe..

Mr. GOODLATTE. Goodlatte.

Mr. FEINSTEIN [continuing]. The courts that have decided this issue against the views of the FTC have gotten it wrong, candidly. We believe that they have adopted what amounts to a per se lawfulness—

Mr. GOODLATTE. But what do you say to Mr. Donatiello's observation that, at least in some of these instances—and perhaps in many of them, if half the time the brand-name manufacturer wins the lawsuit, and given the length of time the litigation itself can take, that in many instances these settlements may result in generic drugs getting to the market sooner rather than later?

Mr. JOHNSON. Mr. Feinstein, before you commit your answer, I am going to just give you some basic information. I believe that you will not be confirmed by the Senate if they have to confirm you—probably makes you—that is, of course, for those who have no humor. [Laughter.]

Mr. GOODLATTE. I think he is saying that you can now answer my question.

Mr. FEINSTEIN. I was trying to figure out what I just did.

The question focused on the argument that 50 percent of these cases are being won—

Mr. GOODLATTE. No, whatever the percentage is, there is certainly going to be a number of instances where either because of the length of time that the litigation takes or because of the fact that the brand-name manufacturer may win the litigation, that a settlement could result in the generic drug getting to market sooner.

Mr. FEINSTEIN. Yes, if you assume that the patent is iron-clad—

Mr. GOODLATTE. I am not assuming anything. I am just saying that parties that enter into these discussions—I would assume that the brand-name manufacturer, if he knew the patent was iron-clad,

wouldn't even consider a settlement because it would allow him to—it would deprive him of market power for a longer period of time than if he just exercised his rights under the patent.

Mr. FEINSTEIN. Yes. And Hatch-Waxman was intended to both stimulate innovation and incentivize generic firms to challenge patents. The problem is not with that process. The problem is with the fact that settlements that include payments distort that process and will cause—if the parties could agree on a date, a settlement that is simply focused on an entry date, that date will always be earlier and, therefore, more beneficial for consumers than a date that is distorted by a payment to keep the potential competitor out of the market longer.

Mr. GOODLATTE. Why is it being distorted by a payment? The payment is a part of the settlement, recognizing the fact that the generic manufacturer may have a valid claim and that, by giving up a longer period of time, they are entitled to some recompense for their loss.

It is just like a settlement that involves an employee getting their job back and also getting compensated for some of their wages that may have been lost. They don't know how much they may get when they go to court and see the judge. And, therefore, there are lots of different elements of a settlement.

There is not one element, like what time you get to market. There is what time you get to market. There is how much compensation you may have lost as a result of giving up your potentially good claim. I mean, this is a very common thing that you have in any type of litigation where you are seeking to have the parties act in a reasonable fashion and avoid the cost to our judicial system of filling up our courts with cases that couldn't be settled because we passed laws that made it harder to settle them.

Mr. FEINSTEIN. And then the concern that we have, again, is that, in this somewhat unique circumstance involving the relationship between branded and generic pharmaceuticals and the impact on the price of the product that will occur when the first generic enters and when subsequent generic enters, that creates an incentive for the brand and the generic to settle in a way that they will share the profits of extending the period of the patent-holder's monopoly to the detriment of consumers. That is the problem.

Mr. GOODLATTE. Let me ask Mr. Donatiello if he would respond to this. The FTC advocates for a per se ban of these settlements, which both PhRMA and most generic manufacturers oppose. Aside from doing nothing in this arena, what would you suggest that Congress do to address this issue as an alternative to this legislation that others here have advocated?

Mr. DONATIELLO. Well, thank you. I just want to point out that, under current law, it is illegal to settle in violation of the antitrust laws. That is already on the books. It is clear.

And what we are—what this bill would do is even from—even if one dollar were paid from the branded to the generic, that would make the settlement illegal, any payment whatsoever.

You know, if Congress feels it necessary to act in this area, the rule of reason has been applied, and it has been applied appropriately in most cases. And it might be appropriate to codify the

current case law, make the rule of reason the proper analysis in these cases. That would be one possibility for action.

Mr. GOODLATTE. But there are more reasonable alternatives than what is being proposed here?

Mr. DONATIELLO. I think that that is the case, yes.

Mr. GOODLATTE. Thank you.

Thank you, Mr. Chairman.

Mr. JOHNSON. Thank you, Mr. Goodlatte.

Next, we will hear from Congresswoman Sheila Jackson Lee.

Ms. JACKSON LEE. Mr. Chairman, thank you for this, I think, crucial and important hearing. Interestingly enough, we have a double opportunity. Our friends and colleagues on the Energy and Commerce, I understand, may be looking at a proposed fix.

And, Mr. Feinstein, let me ask you directly: What do you see as the value of H.R. 1706?

Mr. FEINSTEIN. The value of H.R. 1706 is very straightforward. It would establish a bright line that would eliminate a feature of settlements that occur only in the Hatch-Waxman context that inevitably delay generic entry and which, therefore, cost consumers and taxpayers more dollars than they shouldn't have to pay for needed pharmaceuticals.

And I would note that there is also a provision for the FTC to consider the adoption of rules if it were to develop that these settlements can take some form that is more procompetitive.

Ms. JACKSON LEE. And that is specifically a provision in the legislation that allows the FTC to go forward, a regulatory scheme? Is that what you are saying?

Mr. FEINSTEIN. Yes. The legislation would create a bright line test for certain types of settlements, those which, in this context, which involve a payment. But they would also authorize the FTC to adopt rules going forward if it were to find that there were variations on these settlements that may be procompetitive.

Ms. JACKSON LEE. So, in essence, it would be a parallel initiative alongside of Hatch-Waxman? Is that your understanding? Or would you be amending Hatch-Waxman with H.R. 1706?

Do you—well, why don't—let me—

[CROSSTALK]

Mr. FEINSTEIN. Amendment—

Ms. JACKSON LEE [continuing]. From your framework—

Mr. FEINSTEIN. Right.

Ms. JACKSON LEE [continuing]. Would it be that you would have H.R. 1706, if it were to pass, and then you would have Hatch-Waxman?

Mr. FEINSTEIN. Yes. And this would be at—technically, the bill that has been proposed is an amendment to the FTC act.

Ms. JACKSON LEE. All right. That is how you—because you are not—there is no provision for FTC or is there a provision for FTC in Hatch-Waxman?

Mr. FEINSTEIN. No.

Ms. JACKSON LEE. There is not, all right. And your idea—for example, when we look at the Court of Appeals for the Sixth Circuit, this 2003 case, are you familiar with—it found that an agreement that ended patent litigation between a brand and generic company and included a \$40 million per year payment or payment of \$40

million per year for the generic not to enter the market, it was found to be illegal per se under the Sherman act. And I didn't follow through as to whether or not it was ultimately appealed.

But are you citing that kind of action as creating some of the problems of preventing consumers from getting as quickly to the market a generic drug that might be helpful to them?

Mr. FEINSTEIN. Actually, we cite that as a correct analysis of the relationship between the antitrust laws and the intellectual property laws, that case.

Ms. JACKSON LEE. But you cite—

Mr. FEINSTEIN. Yes, I am sorry. I misunderstood the question. Yes, that—

Ms. JACKSON LEE. There was a payment of \$40 million per year?

Mr. FEINSTEIN. Yes, that is an example of a pay-for-delay settlement, yes.

Ms. JACKSON LEE. Mr. Donatiello, do you consider that an isolated incident? Or do you have an explanation for a concept of giving \$40 million a year? I would probably be very much attracted to \$40 million a year legally, of course, if I was a generic and begin to do my work a little slower. And I don't know how that would impact the health of Americans, but I am obviously concerned about that, even though I sit on the Judiciary Committee.

So how do you respond? How can we handle—circumstance in the framework that we are presently operating in, Hatch-Waxman?

Mr. DONATIELLO. Thank you. I think to some extent that we already have handled it. That case was pre-Medicare Modernization Act of 2003. In that case, the first generic that had filed was paid to stay off the market for an extended period of time. And while they were off the market, subsequent generics could not get in ahead of them. Medicare Modernization Act of 2003 has already done away with that scheme.

Ms. JACKSON LEE. Why don't you refresh our memories?

Mr. DONATIELLO. Okay, so if a subsequent generic comes—challenges the patent and achieves either a court ruling in their favor that would invalidate the patent or shows that their generic is not infringing or a consent judgment—

Ms. JACKSON LEE. This is after Medicare 2003?

Mr. DONATIELLO. Exactly. Exactly. And then the first generic either has to launch or the second generic is allowed to come to market.

Ms. JACKSON LEE. And that has been done by the 2003 modernization? So how do you answer the question of a parallel bill that Mr. Feinstein is talking about?

Mr. DONATIELLO. Well, as I mentioned earlier, it is already illegal to settle in violation of the antitrust laws. And all we are doing with this act would be to limit the flexibility that companies have in order to reach—what can be very appropriate settlements under the—in appropriate circumstances.

You know, we have mentioned in a couple of cases weak patents and large payments for the first generic or generics to stay off the market in light of weak patents. That is actually a good example, because, in that case, we are looking at the underlying facts. Every case is fact-specific.

And what we are advocating is—where the underlying case and the merits of the underlying case are taken into account in making a judgment as to whether the settlement is appropriate. And in those cases where it is a weak patent, it is a large payment for a generic to stay off the market where otherwise they would come to market, then action by the FTC is appropriate.

Ms. JACKSON LEE. But let me quickly—if the Chairman would indulge me—just ask Mr. Vaughan, Mr. Dickey, Mr. Kennedy, and Ms. Bresch quickly to the scheme that I just put forward, with the underlying premise that we should be advocating for better health care for all America and generic drugs contribute to that, this debate between Hatch-Waxman and a potential change in the law.

Mr. Vaughan, your analysis?

Mr. VAUGHAN. It is very important for advancing the cause and improving the health of all Americans. And I think the proof is in the pudding, and things are pretty bad out there. We have settlements. There is a Professor Hemphill out of Columbia who is estimating—and Mr. Feinstein can correct me—but I think about \$12 billion a year in extra consumer costs for the delayed entries agreements that have been reached and that are out there.

So things are bad, and we need you to fix them, please.

Ms. JACKSON LEE. Mr. Dickey, does that then eliminate the availability for brand and pharmaceuticals to invest a large amount of money to then not be competitive in trying to get their product to the market because they don't have this scheme that is in Hatch-Waxman?

Mr. DICKEY. Well, I think in some cases it can delay the entry of a generic drug. But as our paper indicates, there are circumstances where settlements with some sort of reverse payment compensation can actually facilitate a settlement between the companies and bring a generic to market sooner than it otherwise would have come.

Ms. JACKSON LEE. And would that be sooner than the format of 1706?

Mr. DICKEY. Yes, because 1706 would outlaw a settlement with a payment.

Ms. JACKSON LEE. And, quickly, can I get Mr. Kennedy in? Ms. Bresch, would you start, and then Mr. Kennedy?

Ms. BRESCH. So I think, just quickly, what I had said in my testimony is that to even consider anything on the patent settlement bill would be truly irrational without addressing authorized generics. I think that we develop—Mylan has been in business for almost 50 years. And I can tell you, we develop products to bring them to market.

Generics have saved, over the last 10 years, consumers \$740 billion. So I think the idea that we don't want to bring the drugs to market and we want to settle is not the case. The problem is, with the use and abuse of authorized generics, the brand companies have all the leverage. They have stolen something that was given in Hatch-Waxman, and we have to negotiate to get it back.

And it puts us in a very precarious position. And I do believe that we could bring generics even sooner to the market if we were evaluating the litigation truly on its face and not with the threat of the A.G.

And just to address some of the issues I have heard today about the patents being sometimes frivolously gone after in the litigation, what I would say is that patents—the hurdle and the barrier to get a patent issued is much lower than to invalidate or find non-infringement on a patent.

So when you think about the thousands and thousands of patents issued every year and the high hurdle or the lower hurdle there is to receive a patent versus what it takes for a generic company to invalidate or show non-infringement I think is very much the balance that was meant when Hatch-Waxman was struck.

That is why us having the incentive to litigate and see that litigation to fruition and bring in generics sooner is what has saved the consumer \$740 billion, and we are part of the solution going forward, especially in the light of biologics.

Ms. JACKSON LEE. Do you like 1706 or not?

Ms. BRESCH. No.

Ms. JACKSON LEE. And I am ending, Mr. Chairman. Thank you for your indulgence.

Mr. Kennedy, quickly?

Mr. KENNEDY. I feel like if we—that I would like for Congress to think about and this Committee, it is not—we keep talking about the—we keep talking about the first one, to be able to be the first generic to market. Sure, that saves some money.

But I want to remind everybody, the big savings in generics is when you get three, four and five manufacturers in the market. And right now the way Hatch-Waxman is set up and with the litigation processes going on and the reverse payments and the settlements, that keeps your third, fourth and fifth players out of the market.

But the big savings is trying to get more generic manufacturers in the market, not just have one generic manufacturer with a name-brand manufacturer.

Ms. JACKSON LEE. So are you for Hatch-Waxman or—

Mr. KENNEDY. I am for it, yes.

Ms. JACKSON LEE. You are for 1706?

Mr. KENNEDY. I am for 1706, yes.

Ms. JACKSON LEE [continuing]. Person advertising for 1706, but I do want to get a framework for the Judiciary Committee to address. And I thank the Chairman very much for allowing me to pursue my line of questioning. Thank you all. And I believe you will all be Hollywood stars in the next couple of months.

Thank you for your presence here today.

Mr. GONZALEZ. [Presiding.] Thank you very much, Congresswoman Jackson Lee.

The Chair will recognize Mr. Sherman.

Mr. SHERMAN. Thank you, Mr. Chairman.

It is my understanding the FTC already has the authority under current law to review these patent settlements. Mr. Feinstein, why can't you stop the really bad ones, the ones where there is a very substantial delay in a generic coming to market because there is a frivolous patent that, both sides winking at each other, agree to treat seriously, and a big cash payment to one generic company? I mean, that is the poster child for the bill. How come you can't stop those kinds of blatant evasions of the system?

Mr. FEINSTEIN. Well, you are correct, of course, that the settlements have to be submitted to the FTC and Justice Department in advance. What has happened, though, as the case law has developed, we believe that the courts who have, in effect, gotten to a point where these settlements are per se lawful, have distorted the balance that is inherent in Hatch-Waxman.

Mr. SHERMAN. Why did the judges screw it up so badly? And should we simply invalidate all of these agreements or just tell the judge—or just reverse some of the most erroneous of these decisions? Because—

Mr. FEINSTEIN. Well, the—

Mr. SHERMAN [continuing]. We would never—you know, certainly it wasn't Congress's intention that these agreements be per se valid. There is supposed to be a review process.

Mr. FEINSTEIN. Right, and what is—the way the law has evolved is that, as long—and I am paraphrasing—but as long as the period of delay does not exceed the period of the patent, for all practical purposes, the remaining life of the patent, for all practical purposes, these agreements passed muster, as the cases have unfolded.

What that fails to take into account is the reality that the payment will cause the delay to be later than it otherwise would have—that entry would be later than it otherwise would have been.

Mr. SHERMAN. You could have a patent on the main element of the drug that is about to expire, then file another patent on the fact that it is blue with purple stripes, and then somebody agrees that, well, we will delay until that second patent expires, even though the drug would be just as effective without the purple stripes.

Can your commission submit to this Committee proposed legislative language that wouldn't go per se you can never do these agreements, but would reverse what the courts have done in making them per se legal, and return to what Congress originally intended, which was a review process in which the benefits of the settlement for consumers and avoiding litigation are weighed against whether or not this is a real settlement of a real dispute involving a real patent?

Mr. FEINSTEIN. Well, I guess I would say, respectfully, we think that—we think that that is what 1706 does. It is not literally a—it is a bright line. It affords certainty to the participants in these settlements. But it also permits the FTC to develop rules that might permit exceptions.

But we believe that there should be a presumption that it would be embodied in this legislation that payment for delay is unlawful.

Mr. SHERMAN. That goes further than what Congress originally intended.

Let's talk to Mr. Donatiello. The FTC already has this authority to review. They are saying it is not effective because courts have said these agreements are per se legal, as long as one of the many patents that are involved with the drug doesn't expire before the end of the delay period.

Is that your experience? And do you think that your side can present legislation that would give us a reasonable balance here without it being per se legal or per se illegal or even per se illegal with exceptions?

Mr. DONATIELLO. Thank you. I think that one issue here is that, in the settlements that we are talking about, generally I think that it is almost presuming that the patent is invalid. And when we go to—

Mr. SHERMAN. The issue is not only whether the patent is valid, but also whether the patent is consequential.

Mr. DONATIELLO. Well, that is—thank you. That is true. And that is precisely why we advocate a rule of reason test, so that each individual case can be evaluated on its merits and whether that patent really is consequential or not.

Mr. SHERMAN. Now, does current case law give you the rule of reason test you are talking about? Or is Mr. Feinstein correct that the courts have gone all the way to basically saying, “It is not a rule of reason. It is per se valid”?

Mr. DONATIELLO. Well, I believe that current case law judges these settlements on a rule of reason analysis. So I think that—

Mr. SHERMAN. Have any been thrown out?

Mr. DONATIELLO. Have the settlements been thrown out?

Mr. SHERMAN. Yes, where they just say, “Hey, the generic company loves it. The brand-name company loves it. And we, the courts, are going to throw it out”?

Mr. DONATIELLO. I think the only one that I can come up with or that I know of right now that has been thrown out has been—I think it was the Cardizem case. But on the other side, there has only been a handful of these that have gone through court and actually been adjudicated. That is my understanding.

Mr. SHERMAN. And, Mr. Feinstein, if you just—has your agency only challenged a few of these in court?

Mr. FEINSTEIN. We have only challenged a few of them; that is correct. The Cardizem case was a Sixth Circuit decision that Ms. Jackson Lee was referring to earlier, which essentially adopted a per se unlawful approach to these kinds of payments.

But the subsequent cases, the Schering case that was brought by the FTC—and there are several others that are in private—brought by private parties. And we also have several cases pending right now.

Mr. SHERMAN. You do have—so you are by no means sure that the present law—and the courts have slammed the door on your agency’s review? In fact, you haven’t given up the game; you are playing several are on your schedule now.

Mr. FEINSTEIN. We haven’t given up the game. We hope to get, if necessary, to get the Supreme Court to fix this problem. But we believe, candidly, that having Congress fix it is much more efficient and much better for consumers because it will be faster.

Mr. SHERMAN. That is high and undeserved praise for the United States Congress. [Laughter.]

I yield back.

Mr. GONZALEZ. Mr. Sherman, I was going to give you more time, but, with that last remark, your time is up.

But seriously, we are going to be adjourning in a couple of minutes, but I wanted to touch on a couple of points. And the Chairman of the Subcommittee was gracious enough to allow me to pre-
side, so I can ask a couple of questions.

I think the bottom line is that the courts, basically, interpret and apply the law. And at this point, they are saying that the parties in the private capacities are within their rights to enter these agreements that result in, basically, pay-for-delay. I know that is not great as a characterization.

But it is up to the legislature, to Congress to address the issue. And that seems to be the appropriate thing to do. That is going to be the crux of a huge debate that will be taking place over in the Senate side very soon during the confirmation process.

And it appears what Mr. Feinstein is saying, as the regulatory agency to which Congress has delegated authority, in their attempts to do something about pay-for-delay has been frustrated by the court's recent judgment that the parties are within their rights.

But it is also the opinion of many in Congress, as well as the FTC, that these private agreements are frustrating the public policy aspect of the law. And that is when we come in.

I think Mr. Sherman's question has pointed out that payment as one of the provisions of settlement is not totally prohibited, but it does set a bar, and it does set a presumption, and we understand that. But it can still be part of the mix, is my understanding—as your response to both Ms. Jackson Lee and to Mr. Sherman.

But the question really comes down to, are we having in private practice that which frustrates the public policy interests and goals of Hatch-Waxman? And that is what we have here.

So I want to ask you, Mr. Donatiello, what other bargaining chips, positions, elements, factors would be incorporated in a settlement absent money, the payment for the generics to delay, withhold, or whatever? What else would be out there of such a dimension that you could still reach agreements? Or is it a question of paying somebody?

Mr. DONATIELLO. Well, thank you. It is not always a question of paying someone. In some cases, you can reach agreement without a payment. I mean, I certainly have been party to those agreements in certain circumstances, but the issue is really whether payment should make it per se illegal, that whether any payment automatically makes it per se illegal.

I just want to take the opportunity to point out that in the Schering case that we referred to, the FTC's own administrative law judge originally found that that settlement was proper. And then it was—a full commission voted that it was improper, and then it went to court.

So the ultimate judge—the circuit court judge agreed with the administrative law judge that—the FTC's own administrative law judge in that case.

And, again, just each of these—we continue to advocate that each one be evaluated on its own merits and that if there really is a problem, that if the patent is weak and the parties just winked at it, as was indicated earlier, that that is a problem, and that action should be taken in those cases.

Mr. GONZALEZ. Could I—Mr. Feinstein?

Mr. FEINSTEIN. Mr. Chairman, from our perspective, the principal dimension of a negotiation in this context is time. That is the time of entry, that the parties are always free to come to an agree-

ment on when the generic could be permitted to enter in the course of settling their dispute.

The concern that we have is that, when you add the additional dimension of money, it distorts that—it distorts that calculation and will always result in a later date. But they certainly can settle purely on the basis of time.

Mr. GONZALEZ. Well, thank you very much.

And I want to thank all of the witnesses. It has been very enlightening. I want to assure you that other Members of the Subcommittee will have the benefit of your testimony, because, obviously, it is being written and we are taking it down, and will serve as a resource in future debates.

Without objection, Members will have 5 legislative days to submit any additional written questions, which we will forward to the witnesses. And I will ask the witnesses to answer as promptly as you can. It will be made part of the record.

Without objection, the record will remain open for 5 legislative days for the submission of any other additional materials.

With that, this hearing of the Subcommittee on Courts and Competition Policy is adjourned.

[Whereupon, at 11:49 a.m., the Subcommittee was adjourned.]
