

Will LERF models be available for setting thresholds for mitigating and containment systems? There are a limited number of large, early release frequency (LERF) models available to set thresholds for performance of systems that impact the integrity of the containment barrier. In addition, currently available data are inadequate for establishing performance measures for the containment systems. Also, for some systems under the mitigating systems cornerstone, the thresholds associated with changes in core damage frequency (CDF) due to performance degradations may not be limiting compared to changes in LERF. To assess that condition, LERF models that reflect the impact of potential CDF changes are needed. The current plan for developing LERF models over the next several years will support only limited capability for identifying RBPIs or setting plant-specific LERF thresholds.

The NRC has scheduled two public meetings on this matter. The purpose of the first public meeting is to brief external stakeholders on the results of Phase 1 of Risk-Based Performance Indicator development. The purpose of the second public meeting is to discuss external stakeholder comments on the results of Phase-1 RBPI development, and the technical feasibility of applying these concepts in the ROP.
